| Subject: | Geotechnical Design Policy CIP-2 |
|  | Load Resistance Factor Design (LRFD) |
|  | Analysis of a standard cast-in-place (CIP) wall shown as Case IV in the ADOT SD 7.01 drawings. |

The AASHTO (2012) LRFD Bridge Design Specifications are mandatory for all federally funded projects. This attached policy outlines the analysis of a standard cast-in-place (CIP) wall shown as Case IV in the ADOT SD 7.01 drawings, based on methods specified in AASHTO (2012). The intent of this policy is to present the detailed analysis required by the bridge designer to design a typical cast-in-place wall system assuming a level backfill configuration with a traffic barrier and live load surcharge.

Personnel, both within ADOT and design consultants working on projects that require LRFD for cast-inplace walls, shall follow the attached policy. The designer should contact the ADOT Materials Group for an updated version of this policy in the event any interim revisions are made to AASHTO (2012) or a new edition of AASHTO is issued.

The presented solution illustrates the application of the AASHTO LRFD principles and existing ADOT policies to analyze the external stability of the standard wall system for both the strength (bearing resistance, sliding, and limiting eccentricity), and service limit (settlement) states. Two configurations are presented in the example - one where the heel width is less than the width of the barrier slab, and the other where the heel width is greater than the width of the traffic barrier slab.

If you have any questions regarding this bulletin, please contact Norm Wetz at 602-712-8093 or JiannJong Liu at 602-712-8209.

SUBSTRUCTURE EXAMPLE

ADOT SD 7.01
Case IV Walls

This example illustrates the analysis of a standard cast-in-place (CIP) wall shown as Case IV in the ADOT SD 7.01 drawings. The Case IV walls can be divided into two possible configurations, Case IVa and Case IVb. Case IVa applies when the heel width is less than the width of the traffic barrier slab, which is typical for shorter walls. Case IVb applies when the heel width is greater than the width of the traffic barrier slab, which is typical for taller walls. Typical sections of Case IVa and IVb are shown in Figures 1 and 2, respectively.

The following legend is used for the references shown in the left-hand column:

Figure 2 - Case IVb

## Substructure

This example demonstrates the analysis of an ADOT SD 7.01 Case IVb wall as described above. Refer to Figure 2 for more detail. Figure 3 represents the applicable loads for the ADOT SD 7.01 Case IVb wall.

Figure 3 - Case IVb Loads

| $\mathrm{R}_{\mathrm{vb} \text {-str }}$ | Factored Resultant Vertical Force for Bearing Resistance <br> (Strength I Limit State) |
| $\mathrm{R}_{\mathrm{vl}}$ | Factored Resultant Vertical Force for Limiting <br> Eccentricity |
| $\mathrm{R}_{\mathrm{vs}}$ | Factored Resultant Vertical Force for Sliding |
| Load Factors | Load Factor for Permanent Loads |

## Resistance Factors

| $\varphi_{\mathrm{ep}}$ | Passive Earth Resistance Factor |
| :--- | :--- |
| $\varphi_{\tau}$ | Resistance Factor for Frictional Component of Sliding |

## Surcharge

| $\Delta_{\mathrm{p}}$ | Constant Horizontal Earth Pressure Due to Live Load |
| :--- | :--- |
| $\mathrm{h}_{\mathrm{eq}}$ | Equivalent Height of Soil for Vehicular Load |

## Units

The following units were used in this example:

| ft | Feet |
| :--- | :--- |
| in | Inches |
| k | Kips |
| kcf | Kips Per Cubic Foot |
| ksf | Kips Per Square Foot |
| lbs | Pounds |

[ADOT SD 7.01]

## Wall Properties

The following wall properties are based on a 25 ft tall wall:
Wall Footing
$\mathrm{D}_{\mathrm{f}} \quad 4.333 \mathrm{ft}$ (ADOT SD 7.01 recommends a minimum top cover on the toe of 1.5 ft . For this example 2 ft is used)
$\mathrm{t}_{\text {footing }} \quad 2.333 \mathrm{ft}$
$1_{\text {toe }} \quad 4 \mathrm{ft}$
$1_{\text {heel }} \quad 8 \mathrm{ft}$
$\mathrm{W} \quad 14.5 \mathrm{ft}$

Wall Shear Key

| $\mathrm{W}_{\text {key }}$ | 1.5 ft |
| :--- | :--- |
| $\mathrm{t}_{\text {key }}$ | 1.25 ft |

X $\quad 4.167 \mathrm{ft}$
$1_{\text {key }} \quad \mathrm{W}-\mathrm{X}-\mathrm{w}_{\text {key }}=14.5 \mathrm{ft}-4.167 \mathrm{ft}-1.5 \mathrm{ft}=8.833 \mathrm{ft}$
Wall Stem

| $\mathrm{h}_{\text {wall }}$ | 25 ft |
| :--- | :--- |
| $\mathrm{w}_{\mathrm{t}}$ | $12 \mathrm{in}=1 \mathrm{ft}$ |
| $\mathrm{b}_{1}$ | 0 in |
| $\mathrm{b}_{2}$ | $12 \mathrm{in}=1 \mathrm{ft}$ |
| $\mathrm{b}_{3}$ | $18 \mathrm{in}=1.5 \mathrm{ft}$ |
| $\mathrm{w}_{\mathrm{b}}$ | $30 \mathrm{in}=2.5 \mathrm{ft}$ |

Traffic Barrier Properties
$W_{\text {rail }}$
$1.177 \mathrm{ft}(101 / 2 \mathrm{in}+35 / 8 \mathrm{in}$ is assumed to be the average width of the rail due to its non-uniformity)
$h_{\text {rail }}$
$\mathrm{w}_{\text {barrier slab }}$
$t_{\text {barrier slab }}$
6.583 ft
6.583 ft
2.0 ft
0.150 kcf
$\gamma_{\text {barrier }}$
$\mathrm{w}_{\text {barrier overlap }}$ (Case IVa)
0 ft
$\mathrm{w}_{\text {footing overlap }}$ (Case IVb)
$2.917 \mathrm{ft}\left(\mathrm{l}_{\text {heel }}+\mathrm{b}_{3}-\mathrm{w}_{\text {barrier slab }}=8.0 \mathrm{ft}+\right.$ $1.5 \mathrm{ft}-6.583 \mathrm{ft}=2.917 \mathrm{ft})$
Soil Properties (Assumed for Example)
Backfill
$\begin{array}{ll}\gamma_{\mathrm{b}}^{\prime} & 0.120 \mathrm{kcf} \\ \varphi_{\mathrm{b}}^{\prime} & 33.25 \mathrm{deg}\end{array}$
$\mathrm{c}^{\prime}{ }_{\mathrm{b}} \quad 0 \mathrm{ksf}$
Embedment

| $\gamma_{\mathrm{e}}^{\prime}$ | 0.120 kcf |  |
| :--- | :--- | :--- |
| $\varphi_{\mathrm{e}}^{\prime}$ | 30 deg |  |
| $\mathrm{c}_{\mathrm{e}}^{\prime}$ |  | 0 ksf |

$\gamma_{\mathrm{e}}^{\prime} \quad 0.120 \mathrm{kcf}$
$\mathrm{c}^{\prime}{ }_{\mathrm{e}} \quad 0 \mathrm{ksf}$
[ADOT SF-2]
[3.11.6.4-2]
[ADOT SF-3]
[10.5.5.2.2-1]
[10.5.5.2.2-1]
[10.5.5.2.2-1]

## Foundation

| $\gamma_{f}^{\prime}$ | 0.120 kcf |
| :--- | :--- |
| $\varphi^{\prime}$ | 34 deg |
| $\mathrm{c}_{\mathrm{f}}^{\prime}$ | 0 ksf |

Concrete Properties

$$
\gamma_{\mathrm{c}} \quad 0.150 \mathrm{kcf}
$$

Backslope Properties and Surcharge
Backslope
$\beta \quad 0$, since there is no backslope for this example
Backslope Vertical Plane (U-V)
$\delta \quad 0$ deg
$\theta \quad 90 \mathrm{deg}$

## Surcharge

Since traffic is running parallel to the face of the wall, and is located greater than 1.0 feet from the inside of the wall face, $\mathrm{h}_{\mathrm{eq}}$ can be determined as follows:

$$
\mathrm{h}_{\mathrm{eq}} \quad 2 \mathrm{ft}
$$

Passive Resistance Factor and Sliding Factors
Footing from Toe to Front of Key

| Method/Soil/Condition | Soil on Soil |
| :--- | :--- |
| $\varphi_{\tau 1}$ | 0.90 |
| $\tan \varphi_{f}^{\prime}=\tan (34 \mathrm{deg})$ | 0.6745 |

Footing from Heel to Front of Key

| Method/Soil/Condition | Cast-in-Place Concrete Placed on Sand |
| :--- | :--- |
| $\varphi_{\tau 2}$ | 0.80 |
| $\tan \varphi_{\mathrm{f}}^{\prime}=\tan (34 \mathrm{deg})$ | 0.6745 |

Factored Sliding Coefficient (Weighted)
$\varphi_{\tau} \tan \varphi_{\mathrm{f}}^{\prime}=\left[1_{\mathrm{key}}\left(\varphi_{\tau 1}\right)\left(\tan \varphi_{\mathrm{f}}^{\prime}\right)+\left(\mathrm{W}_{\text {key }}+\mathrm{X}\right)\left(\varphi_{\tau 2}\right)\left(\tan \varphi_{\mathrm{f}}^{\prime}\right)\right] / \mathrm{W}$
$\varphi_{\tau} \tan \varphi_{f}^{\prime}=[(8.833 \mathrm{ft})(0.90)(0.6745)+(5.667 \mathrm{ft})(0.80)(0.6745)] / 14.5 \mathrm{ft}$
$\varphi_{\tau} \tan \varphi_{f}^{\prime}=0.5807$
Passive Earth Resistance Factor
$\varphi_{\text {ep }}$
0.50

Load Factors ( $\gamma_{\mathrm{p}}$ )
Strength I Limit State and Service I Limit State will be used for this example. The following load factors pertain to the Strength I Limit State and Service I Limit State (in actual design all applicable limit states must be considered):
[3.4.1-1] \&
[3.4.1-2]

| Load Categories | Load Factors (Str I) |  | Load |
| :--- | :---: | :---: | :---: |
| Maximum | Minimum | Factors <br> (Ser I) |  |
| DC: Component and Attachments | 1.25 | 0.90 | 1.00 |
| EV: Vertical Earth Pressure - <br> Retaining Walls and Abutments | 1.35 | 1.00 | 1.00 |
| EH: Horizontal Earth Pressure - Active | 1.50 | 0.90 | 1.00 |
| LS: Live Load Surcharge | 1.75 | 1.75 | 1.00 |

## Unfactored Loads and Moments

First the unfactored values of loads and moments are calculated. These unfactored values will then be factored as appropriate based on the limit state being analyzed, e.g. sliding, limiting eccentricity or bearing. For the various terms in the equations for unfactored loads and moments refer to Figures 2 and 3 and definitions noted previously in this example.

## Load Designations

A summary of the loads for this example are as follows:

| Load | Load Category |
| :--- | :---: |
| C1 | DC |
| C2 | Not used for this example since $b_{1}=0$ |
| C3 | DC |
| C4 | DC |
| C5 | DC |
| C6 | DC |
| C7 | DC |
| S1 | EV |
| S2 | EV (used only for bearing resistance comps) |
| S4 | Not used for this example since $b_{1}=0$ |
| S5 | EV |
| S6 | LS (used only for bearing resistance comps) |
| S7 | EH |
| $P_{a}$ | LS |
| $P_{\mathrm{s}}$ | Passive resistance force, use passive resistance factors |
| $\mathrm{P}_{\mathrm{pf}}$ | Used only for Extreme Event Analysis |
| $\mathrm{H}_{\mathrm{impact}}$ |  |

## DC Loads (Unfactored)

## Stem

$\mathrm{C} 1=\mathrm{b}_{2} \mathrm{~h}_{\text {wall }} \gamma_{\mathrm{c}}=(1 \mathrm{ft})(25 \mathrm{ft})(0.150 \mathrm{kcf})=3.750 \mathrm{k} / \mathrm{ft}$
$\mathrm{C} 2=1 / 2 \mathrm{~b}_{1} \mathrm{~h}_{\text {wall }} \gamma_{\mathrm{c}}=0$, since $\mathrm{b}_{1}=0$
$\mathrm{C} 3=1 / 2 \mathrm{~b}_{3}\left(\mathrm{~h}_{\text {wall }}-\mathrm{t}_{\text {barrier slab }}\right) \gamma_{\mathrm{c}}=(0.5)(1.5 \mathrm{ft})(25 \mathrm{ft}-2 \mathrm{ft})(0.150 \mathrm{kcf})$ $=2.588 \mathrm{k} / \mathrm{ft}$

Footing
$\mathrm{C} 4=\mathrm{W} \mathrm{t}_{\text {footing }} \gamma_{\mathrm{c}}=(14.5 \mathrm{ft})(2.333 \mathrm{ft})(0.150 \mathrm{kcf})=5.074 \mathrm{k} / \mathrm{ft}$

## Shear Key

$\mathrm{C} 5=\mathrm{w}_{\text {key }} \mathrm{t}_{\text {key }} \gamma_{\mathrm{c}}=(1.5 \mathrm{ft})(1.25 \mathrm{ft})(0.150 \mathrm{kcf})=0.2813 \mathrm{k} / \mathrm{ft}$

## Traffic Barrier

$\mathrm{C} 6=\mathrm{w}_{\text {barrier slab }} \mathrm{t}_{\text {barrier slab }} \gamma_{\text {barrier }}=(6.583 \mathrm{ft})(2.0 \mathrm{ft})(0.150 \mathrm{kcf})=1.975 \mathrm{k} / \mathrm{ft}$
$\mathrm{C} 7=\mathrm{w}_{\text {rail }} \mathrm{h}_{\text {rail }} \gamma_{\text {barrier }}=(1.177 \mathrm{ft})(3.667 \mathrm{ft})(0.150 \mathrm{kcf})=0.6474 \mathrm{k} / \mathrm{ft}$

## EV Loads (Unfactored)

Heel
$\mathrm{S} 1=\mathrm{l}_{\text {heel }}\left(\mathrm{h}_{\text {wall }}-\mathrm{t}_{\text {barrier slab }}\right) \gamma_{\mathrm{b}}{ }_{\mathrm{b}}=(8 \mathrm{ft})(25 \mathrm{ft}-2 \mathrm{ft})(0.120 \mathrm{kcf})=22.08 \mathrm{k} / \mathrm{ft}$
$\mathrm{S} 2=1 / 2 \mathrm{~b}_{3}\left(\mathrm{~h}_{\text {wall }}-\mathrm{t}_{\text {barrier slab }}\right) \gamma_{\mathrm{b}}^{\prime}=(0.5)(1.5 \mathrm{ft})(25 \mathrm{ft}-2 \mathrm{ft})(0.120 \mathrm{kcf})$ $=2.070 \mathrm{k} / \mathrm{ft}$

Toe
$\overline{\mathrm{S} 4}=1_{\text {toe }}\left(\mathrm{D}_{\mathrm{f}}-\mathrm{t}_{\text {footing }}\right) \gamma_{\mathrm{e}}^{\prime}=(4 \mathrm{ft})(4.333 \mathrm{ft}-2.333 \mathrm{ft})(0.120 \mathrm{kcf})$ $=0.9600 \mathrm{k} / \mathrm{ft}$
$\mathrm{S} 5=0$, since $\mathrm{b}_{1}=0$
Overlap
$\mathrm{S} 6=\mathrm{w}_{\text {footing overlap }} \mathrm{t}_{\text {barrier slab }} \gamma_{\mathrm{b}}{ }_{\mathrm{b}}=(2.917 \mathrm{ft})(2 \mathrm{ft})(0.120 \mathrm{kcf})=0.7001 \mathrm{k} / \mathrm{ft}$

## EH Loads (Unfactored)

## Active Earth Pressure

$\mathrm{P}_{\mathrm{a}}$ can be determined by the following equation:

$$
\begin{aligned}
& \mathrm{P}_{\mathrm{a}}=1 / 2\left(\mathrm{~K}_{\mathrm{ab}} \gamma_{\mathrm{b}}^{\prime}\right)\left(\mathrm{h}_{\text {wall }}+\mathrm{t}_{\text {footing }}\right)^{2} \\
& \mathrm{~K}_{\mathrm{a}}=\frac{\sin ^{2}\left(\theta+\varphi^{\prime}\right)}{\Gamma\left[\sin ^{2} \theta \sin (\theta-\delta)\right]} \\
& \Gamma=\left[1+\sqrt{\frac{\sin \left(\varphi^{\prime}+\delta\right) \sin \left(\varphi^{\prime}-\beta\right)}{\sin (\theta-\delta) \sin (\theta+\beta)}}\right]^{2}
\end{aligned}
$$

Since $\delta=\beta=0$ and $\theta=90$ deg, the equations for $\mathrm{K}_{\mathrm{a}}$ and $\Gamma$ can be rewritten as follows:

$$
\begin{aligned}
& \Gamma=\left[1+\sin \left(\varphi^{\prime}\right)\right]^{2} \\
& K_{a}=\frac{\sin ^{2}\left(90+\varphi^{\prime}\right)}{\Gamma}=\frac{\sin ^{2}(90) \cos ^{2}\left(\varphi^{\prime}\right)+\cos ^{2}(90) \sin ^{2}\left(\varphi^{\prime}\right)}{\left[1+\sin \left(\varphi^{\prime}\right)\right]^{2}} \\
& K_{\mathrm{a}}=\frac{\cos ^{2}\left(\varphi^{\prime}\right)}{\left[1+\sin \left(\varphi^{\prime}\right)\right]^{2}}=\frac{1-\sin ^{2}\left(\varphi^{\prime}\right)}{\left[1+\sin \left(\varphi^{\prime}\right)\right]^{2}}=\frac{\left(1-\sin \left(\varphi^{\prime}\right)\right)\left(1+\sin \left(\varphi^{\prime}\right)\right)}{\left[1+\sin \left(\varphi^{\prime}\right)\right]^{2}}=\frac{1-\sin \left(\varphi^{\prime}\right)}{1+\sin \left(\varphi^{\prime}\right)}
\end{aligned}
$$

Therefore, $\mathrm{K}_{\mathrm{ab}}=\frac{1-\sin \left(\varphi_{\mathrm{b}}^{\prime}\right)}{1+\sin \left(\varphi_{\mathrm{b}}^{\prime}\right)}=\frac{1-\sin (33.25)}{1+\sin (33.25)}=0.2917$
$\mathrm{P}_{\mathrm{a}}=1 / 2(0.2917)(0.120 \mathrm{kcf})(25 \mathrm{ft}+2.333 \mathrm{ft})^{2}=13.08 \mathrm{k} / \mathrm{ft}$
[Figure C11.5.53a]
[Figure 3.11.5.41]

## LS Loads (Unfactored)

Live Load Surcharge
$\mathrm{S} 7=\mathrm{s}\left(\mathrm{b}_{3}+\mathrm{l}_{\text {heel }}\right)$

$$
\mathrm{s}=\mathrm{h}_{\mathrm{eq}} \gamma_{\mathrm{b}}^{\prime}=(2 \mathrm{ft})(0.120 \mathrm{kcf})=0.2400 \mathrm{ksf}
$$

$\mathrm{S} 7=(0.2400 \mathrm{ksf})(1.5 \mathrm{ft}+8 \mathrm{ft})=2.280 \mathrm{k} / \mathrm{ft}$
Lateral Load Due To Live Load Surcharge
$\mathrm{P}_{\mathrm{s}}=\Delta_{\mathrm{p}}\left(\mathrm{h}_{\text {wall }}+\mathrm{t}_{\text {footing }}\right)$

$$
\Delta_{\mathrm{p}}=\mathrm{K}_{\mathrm{ab}} \mathrm{~s}=(0.2917)(0.2400 \mathrm{ksf})=0.07001 \mathrm{ksf}
$$

$$
\mathrm{P}_{\mathrm{s}}=(0.07001 \mathrm{ksf})(25 \mathrm{ft}+2.333 \mathrm{ft})=1.914 \mathrm{k} / \mathrm{ft}
$$

## Passive Earth Resistance

Use passive resistance from top of footing to bottom of key. See Figure 3 for more detail.

$$
\mathrm{P}_{\mathrm{pf}}=\frac{\mathrm{K}_{\mathrm{pf}} \gamma^{\prime} \mathrm{f}_{\mathrm{key}}^{2}}{2}+\mathrm{K}_{\mathrm{pf}} \gamma^{\prime} \mathrm{f}_{\mathrm{f}} \mathrm{t}_{\text {footing }}\left(\mathrm{t}_{\mathrm{key}}\right)+\frac{\mathrm{K}_{\mathrm{pf}} \gamma^{\prime} \mathrm{f} \mathrm{f}_{\text {footing }}^{2}}{2}
$$

To determine the passive earth resistance, the passive earth resistance coefficient for the foundation soils must be determined. Using $\theta=90$ deg and $\varphi_{f}^{\prime}=34 \mathrm{deg}$ in the referenced figure, $\mathrm{K}_{\mathrm{pf}}$ was determined for the ratio of $\delta / \varphi_{\mathrm{f}}^{\prime}=$ -1.

$$
\mathrm{K}_{\mathrm{pf}}=9.25 \text { for } \delta / \varphi_{\mathrm{f}}^{\prime}=-1
$$

Using $\delta=0$, the following values are established:

$$
\begin{array}{ll}
\text { Reduction Factor for } \mathrm{K}_{\mathrm{pf}} \text { for } \varphi_{\mathrm{f}}^{\prime}=30 \mathrm{deg} & 0.467 \\
\text { Reduction Factor for } \mathrm{K}_{\mathrm{pf}} \text { for } \varphi_{\mathrm{f}}^{\prime}=35 \mathrm{deg} & 0.362
\end{array}
$$

Using linear interpolation, the reduction factor for $\varphi_{f}^{\prime}=34 \mathrm{deg}$ was determined as follows:

$$
\text { Reduction Factor for } \mathrm{K}_{\mathrm{pf}} \text { for } \varphi_{\mathrm{f}}^{\prime}=34 \mathrm{deg}
$$

$$
\frac{(0.467-0.362)}{5}+0.362=0.383
$$

$\mathrm{K}_{\mathrm{pf}}$ for the ratio of $\delta / \varphi_{\mathrm{f}}^{\prime}=0$ is as follows:

$$
\mathrm{K}_{\mathrm{pf}}=0.383(9.25)=3.54
$$

The passive earth resistance can now be determined as follows:

$$
\begin{aligned}
\mathrm{P}_{\mathrm{pf}}= & \frac{(3.54)(0.120 \mathrm{kcf})(1.25 \mathrm{ft})^{2}}{2}+(3.54)(0.120 \mathrm{kcf})(1.25 \mathrm{ft})(2.333 \mathrm{ft})+ \\
\frac{(3.54)(0.120 \mathrm{kcf})(2.333 \mathrm{ft})^{2}}{2} & =2.727 \frac{\mathrm{k}}{\mathrm{ft}}
\end{aligned}
$$

Moment Arm (From Bottom of Footing at the Toe)
Before the moments due to the loads shown above can be determined, the moment arm must be determined for each load. The following table summarises the moment arms:

| Load | Moment Arm Equation |  | $\begin{array}{c}\text { Moment Arm } \\ (\mathbf{f t})\end{array}$ |
| :--- | :--- | :--- | :---: |
| C 1 | $\mathrm{l}_{\text {toe }}+\mathrm{b}_{1}+\mathrm{b}_{2} / 2$ | $4 \mathrm{ft}+0+(1 \mathrm{ft}) / 2$ | 4.500 |
| C 3 | $\mathrm{l}_{\text {toe }}+\mathrm{b}_{1}+\mathrm{b}_{2}+\mathrm{b}_{3} / 3$ | $4 \mathrm{ft}+0+1 \mathrm{ft}+(1.5 \mathrm{ft}) / 3$ | 5.500 |
| C 4 | $\mathrm{~W} / 2$ | $(14.5 \mathrm{ft}) / 2$ | 7.250 |
| C 5 | $\mathrm{~W}-\mathrm{X}-\mathrm{w}_{\text {key }} / 2$ | $14.5 \mathrm{ft}-4.167 \mathrm{ft}-(1.5 \mathrm{ft}) / 2$ | 9.583 |
| C 6 | $\mathrm{~W}-\mathrm{w}_{\text {footing }}$ |  |  |
|  |  |  |  |
| $\mathrm{w}_{\text {barrier slab }} / 2$ |  |  |  |$)$

## Moments (Unfactored) From Bottom of Footing at the Toe

Now that the unfactored loads and moment arms have been determined, the unfactored moments for each contributing force shown in Figure 3 can be determined. The unfactored moment is calculated by multiplying the moment arm with the unfactored load. A counter-clockwise moment is considered to be positive. The following table summarizes the resulting unfactored moments:

|  | +/- | Moment Arm <br> $(\mathbf{f t})$ | Load <br> (Unfactored) <br> $(\mathbf{k} / \mathbf{f t})$ | Moment <br> (Unfactored) <br> (k-ft/ft) |
| :--- | :---: | :---: | :---: | :---: |
| $\mathrm{M}_{\mathrm{C} 1}$ | - | 4.500 | 3.750 | -16.88 |
| $\mathrm{M}_{\mathrm{C} 3}$ | - | 5.500 | 2.588 | -14.23 |
| $\mathrm{M}_{\mathrm{C} 4}$ | - | 7.250 | 5.074 | -36.79 |
| $\mathrm{M}_{\mathrm{C} 5}$ | - | 9.583 | 0.2813 | -2.696 |
| $\mathrm{M}_{\mathrm{C} 6}$ | - | 8.292 | 1.975 | -16.38 |
| $\mathrm{M}_{\mathrm{C} 7}$ | - | 5.589 | 0.6474 | -3.618 |
| $\mathrm{M}_{\mathrm{S} 1}$ | - | 10.50 | 22.08 | -231.8 |
| $\mathrm{M}_{\mathrm{S} 2}$ | - | 6.000 | 2.070 | -12.42 |
| $\mathrm{M}_{\mathrm{S} 4}$ | - | 2.000 | 0.9600 | -1.920 |
| $\mathrm{M}_{\mathrm{S} 6}$ | - | 13.04 | 0.7001 | -9.129 |
| $\mathrm{M}_{\mathrm{S} 7}$ | - | 9.750 | 2.280 | -22.23 |
| $\mathrm{M}_{\mathrm{Pa}}$ | + | 9.111 | 13.08 | 119.2 |
| $\mathrm{M}_{\mathrm{P} 5}$ | + | 13.67 | 1.914 | 26.16 |

## Check for Sliding

## Factored Vertical Loads For Sliding (Strength I)

Sliding is strength limit check and therefore factored loads are used. Strength I limit state is being used for this example. In actual design, all applicable load combinations must be evaluated. For resisting loads, i.e., loads that are providing resistance to sliding, the minimum load factor will be applied. For activating loads, i.e., loads that contribute to activate sliding, the maximum load factor will be applied. The beneficial contribution of the toe soil weight (shown as S 4 in Figure 3) and live load surcharge (shown as S 7 in Figure 3) to the resisting forces will be neglected for sliding to create the critical force effect. The following tables summarize the factored loads with respect to sliding:

| Factored Vertical Loads for Sliding (Str I) |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Load Factors |  | Load <br> (Unfactored) <br> (k/ft) | Factored <br> Load <br> (Str I) <br> (k/ft) |
|  | Max / <br> Min | Factor | 3.750 | 3.375 |
| C1 | Min | 0.90 | 2.588 | 2.329 |
| C3 | Min | 0.90 | 5.074 | 4.567 |
| C4 | Min | 0.90 | 0.2813 | 0.2532 |
| C5 | Min | 0.90 | 1.975 | 1.778 |
| C6 | Min | 0.90 | 0.6474 | 0.5827 |
| C7 | Min | 0.90 | 22.08 | 22.08 |
| S1 | Min | 1.00 | 2.070 | 2.070 |
| S2 | Min | 1.00 | 0.7001 | 0.7001 |
| S6 | Min | 1.00 | 0.74 |  |
|  |  |  |  |  |

| Factored Horizontal Loads for Sliding (Str I) |  |  |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Load Factors |  | Load <br> (Unfactored) <br> $(\mathbf{k} / \mathbf{f t})$ | Factored <br> Load <br> (Str I) <br> $(\mathbf{k} / \mathbf{f t})$ |  |  |  |  |
|  | Max / <br> Min | Factor | 13.08 | 19.62 |  |  |  |  |
|  | Max | 1.50 | 1.350 |  |  |  |  |  |
|  | Max |  |  |  |  | 1.75 | 1.914 | 3.350 |
| $\mathrm{R}_{\mathrm{hs}}=\sum$ Factored Horizontal Loads |  |  |  | 22.97 |  |  |  |  |

Factored Friction Resistance, $\mathbf{R}_{\mathbf{f}}$

$$
\mathrm{R}_{\mathrm{f}}=\mathrm{R}_{\mathrm{vs}} \varphi_{\mathrm{t}} \tan \varphi_{\mathrm{f}}^{\prime}=(37.74 \mathrm{k} / \mathrm{ft})(0.5807)=21.92 \mathrm{k} / \mathrm{ft}
$$

Factored Passive Resistance, $\mathbf{R}_{\mathbf{p}}$

$$
\mathrm{R}_{\mathrm{p}}=\mathrm{P}_{\mathrm{pf}} \varphi_{\mathrm{ep}}=(2.727 \mathrm{k} / \mathrm{ft})(0.50)=1.364 \mathrm{k} / \mathrm{ft}
$$

Total Factored Sliding Resistance, $\mathbf{R}_{\text {s }}$ $\mathrm{R}_{\mathrm{s}}=\mathrm{R}_{\mathrm{f}}+\mathrm{R}_{\mathrm{p}}=21.92 \mathrm{k} / \mathrm{ft}+1.364 \mathrm{k} / \mathrm{ft}=23.28 \mathrm{k} / \mathrm{ft}$

## Resistance:Load Ratio (RLR) Against Sliding

The RLR should be greater than 1.
RLR $=$ (Factored resisting forces $/$ Factored activating forces)

$$
=\left(\mathrm{R}_{\mathrm{s}}\right) /\left(\mathrm{R}_{\mathrm{hs}}\right)=(23.28 \mathrm{k} / \mathrm{ft}) /(22.97 \mathrm{k} / \mathrm{ft})=1.014
$$

$\operatorname{RLR}=1.014$. Therefore the wall is ok with respect to sliding.

## Check for Limiting Eccentricity

## Factored Loads and Moments For Limiting Eccentricity (Strength I)

Limiting eccentricity is a strength limit check. The Strength I limit state is being used for this example. In actual design, all applicable load combinations must be evaluated. For resisting loads the minimum load factor will be applied. For activating loads the maximum load factor will be applied. The load factor that is applied to each load is automatically applied to its corresponding moment as well. The beneficial contribution of the toe soil weight (shown as S4 in Figure 3), live load surcharge (shown as S7 in Figure 3), and passive earth resistance (shown as $\mathrm{P}_{\mathrm{pf}}$ in Figure 3) to the resisting forces and moments will be neglected for limiting eccentricity to create the critical force effect. The following tables summarize the factored loads and moments with respect to limiting eccentricity:

| Factored Vertical Loads for Limiting Eccentricity (Str I) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Load Factors |  | Load (Unfactored) (k/ft) | Factored Load (Str I) (k/ft) |
|  | Max/ <br> Min | Factor |  |  |
| C1 | Min | 0.90 | 3.750 | 3.375 |
| C3 | Min | 0.90 | 2.588 | 2.329 |
| C4 | Min | 0.90 | 5.074 | 4.567 |

| $\mathrm{M}_{\mathrm{Ps}}$ | Max | 1.75 | 26.16 | 45.78 |
| $\mathrm{M}_{\mathrm{Rl} 1}=(-1)\left(\sum\right.$ Factored Moments) |  |  |  | 110.3 |

Distance from Toe to $\mathbf{R}_{\mathrm{vl}}$

$$
\mathrm{D}_{\mathrm{l}}=\mathrm{M}_{\mathrm{Rl}} / \mathrm{R}_{\mathrm{vl}}=(110.3 \mathrm{k}-\mathrm{ft} / \mathrm{ft}) /(37.74 \mathrm{k} / \mathrm{ft})=2.923 \mathrm{ft}
$$

## Limiting Eccentricity

If the value of the computed eccentricity, $e_{1}$, is less than the limiting eccentricity, $\mathrm{e}_{\text {max }}$, then the substructure meets the criterion for limiting eccentricity and is therefore safe against overturning.
$\mathrm{e}_{1}=\mathrm{D}_{1}-\mathrm{W} / 2=2.923 \mathrm{ft}-(14.5 \mathrm{ft}) / 2=-4.327 \mathrm{ft}=4.327 \mathrm{ft}$ towards the toe of the wall from the middle of the footing.
$\mathrm{e}_{\text {max }}=\mathrm{W} / 3=(14.5 \mathrm{ft}) / 3=4.833 \mathrm{ft}$
$e_{\text {max }}=4.833 \mathrm{ft}$, which is greater than $\mathrm{e}_{1}=4.327 \mathrm{ft}$. Therefore the wall is ok with respect to limiting eccentricity.

## Check For Bearing Resistance

Factored Loads and Moments For Bearing Resistance
Bearing resistance is a strength limit state check. Also, the vertical live load
[Figure C11.5.53a]
[ADOT SF-1]
[ADOT SF-1]
[3.4.1-1]
surcharge is included for bearing resistance analysis since it will now be contributing to the bearing stresses. Refer to Figure 3 for more detail. The total equivalent uniform vertical bearing stress ( $\mathrm{q}_{\text {tveu }}$ ) and net equivavlent uniform bearing stress ( $\mathrm{q}_{\text {nveu }}$ ) at the base of the wall can be computed as follows:

$$
\mathrm{q}_{\mathrm{tveu}}=\mathrm{R}_{\mathrm{vb}} / \mathrm{B}^{\prime}
$$

Where $\mathrm{R}_{\mathrm{vb}}=\sum$ Factored vertical loads for bearing resistance
$\mathrm{B}^{\prime}=\mathrm{W}-2 \mathrm{e}_{\mathrm{b}}$
$\mathrm{W}=$ Wall footing width
$\mathrm{e}_{\mathrm{b}}=$ Eccentricty of $\mathrm{R}_{\mathrm{vb}}$
$q_{\text {nveu }}=q_{\text {tveu }}-\gamma_{p}\left(\gamma^{\prime}{ }_{e} D_{f}\right)$
Where $\gamma_{\mathrm{p}}=$ Load factor of permanent vertical earth pressure (EV). Use the max EV load factor for this case (1.35)
$\gamma^{\prime}{ }_{\mathrm{e}}=$ Embedment soil unit weight
$D_{f}=$ Depth of embedment
The Strength I limit state will be used for this example to determine the bearing resistance. In actual design, all applicable load combinations must be evaluated. It is assumed for this example that the critical combination of load factors for bearing resistance will be when the maximum load factor is applied to all loads. The load factor that is applied to each load is automatically applied to its corresponding moment as well. The beneficial contribution of the passive earth resistance (shown as $\mathrm{P}_{\mathrm{pf}}$ in Figure 3) to the resisting forces and moments will be neglected for bearing resistance. The following tables summarize the factored loads and moments with respect to bearing resistance:

| Factored Vertical Loads for Bearing Resistance |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Load Factors |  | Load <br> (Unfactored) <br> (k/ft) | Str I <br> Factored Load <br> $(\mathbf{k} / \mathbf{f t})$ |

& \mathrm{q}_{\text {nveu-str }}=\mathrm{q}_{\text {tveu-str }}-\gamma_{\mathrm{p}}\left(\gamma_{\mathrm{e}}^{\prime} \mathrm{D}_{\mathrm{f}}\right)=5.912 \mathrm{ksf}-1.35(0.120 \mathrm{kcf}(4.333 \mathrm{ft})) \\
& \mathrm{q}_{\text {nveu-str }}=5.210 \mathrm{ksf}
\end{aligned}
$$

## Factored Net Bearing Resistance (Strength I Limit State)

For this example, it is assumed that the site specific soil profile for this example is the same as that which was used in the ADOT SF-1 policy memorandum. Therefore the factored net bearing resistance chart shown as Figure 1 in the ADOT SF-1 policy memorandum is applicable for this example (Note that a
site specific factored net bearing resistance chart will need to be generated for actual design). The factored net bearing resistance chart shown as Figure 1 in the ADOT SF-1 policy memorandum has been included in this example as Figures 5 and 6, to determine $\mathrm{q}_{\mathrm{nf} \text {-str }}$ and settlement, respectively.

Note that the factored net bearing resistance chart from the ADOT SF-1 policy memorandum was developed for a minimum depth of embedment, $D_{f}$, of 6 feet. The depth of embedment analyzed in this example is only 4.333 feet. In actual design a new factored net bearing resistance chart must be developed with a depth of embedment less than or equal to 4.333 feet. However, for demonstration purposes it is assumed that the factored net bearing resistance chart shown in the ADOT SF-1 policy memorandum is sufficient for this example.

Using Figure 5 and $\mathrm{B}_{\text {str }}$ equal to 9.596 feet, the following factored net bearing resistance was determined (Note that the solid lines with closed arrows in Figure 5 represent the estimation of $\mathrm{q}_{\mathrm{nf} \text {-str }}$ ):

$$
\begin{aligned}
& \mathrm{q}_{\mathrm{nf}-\text { str }}=8.60 \mathrm{ksf} \\
& \mathrm{RLR}=(\text { Bearing resistance } / \text { Bearing stress })=(8.60 \mathrm{ksf}) /(5.210 \mathrm{ksf})= \\
& 1.651 \text {, which is }>1.00 \text {, therefore the wall is ok with respect to bearing } \\
& \text { resistance. }
\end{aligned}
$$

${ }^{4}$ Figure 1: Example of a Factored Bearing Resistance Chart for a footing of length, $\mathrm{L}^{\prime}=\mathrm{L}=150$ ft (no eccentricity) and depth of embedment, $\mathrm{D}_{\mathrm{f}}=6-\mathrm{ft}$ with base elevation of $994-\mathrm{ft}$. The resistance factor of $\phi_{\mathrm{b}}=0.45$ is included in the strength limit state curve. " S " in the legend refers to immediate settlement.

Figure 5 - Factored Net Bearing Resistance Chart Used to Determine $\mathbf{q}_{\mathrm{nf} \text {-str }}$ (ADOT SF-1)

## Check For Settlement

## Factored Loads and Moments For Settlement

Settlement is a service limit state check. Also, the live load surcharge is included on top of the wall for settlement analysis since it will now be contributing to the bearing stresses. Refer to Figure 3 for more detail.

The Service I limit state will be used for this example to determine the settlement. In actual design, all applicable load combinations must be evaluated. The beneficial contribution of the passive earth resistance (shown as $\mathrm{P}_{\mathrm{pf}}$ in Figure 3) to the resisting forces and moments will be neglected. The following tables summarize the factored loads and moments with respect to settlement:

| Factored Vertical Loads for Settlement |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Load Factors |  | Load <br> (Unfactored) <br> (k/ft) | Ser I <br> Factored Load <br> $(\mathbf{k} / \mathbf{f t})$ |

Distance from Toe to $\mathbf{R}_{\mathbf{v b}}$

$$
D_{b-\text {-er }}=M_{R b-s e r} / R_{v b-s e r}=(222.7 \mathrm{k}-\mathrm{ft} / \mathrm{ft}) /(42.41 \mathrm{k} / \mathrm{ft})=5.251 \mathrm{ft}
$$

## Eccentricity

$\mathrm{e}_{\mathrm{b} \text {-ser }}=\mathrm{D}_{\mathrm{b} \text {-ser }}-\mathrm{W} / 2=5.251 \mathrm{ft}-(14.5 \mathrm{ft}) / 2=-1.999 \mathrm{ft}=1.999 \mathrm{ft}$ towards the toe of the wall from the middle of the footing.

Factored Total Equivalent Uniform Vertical Bearing Stress

$$
\begin{aligned}
& \mathrm{B}_{\text {ser }}^{\prime}=\mathrm{W}-2 \mathrm{e}_{\mathrm{b} \text {-ser }}=14.5 \mathrm{ft}-2(1.999 \mathrm{ft})=10.50 \mathrm{ft} \\
& \left.\mathrm{q}_{\mathrm{tveu}-\text {-ser }}=\mathrm{R}_{\mathrm{vb} \text {-ser }} /\left(\mathrm{B}_{\text {ser }}^{\prime}\right)=(42.41 \mathrm{k} / \mathrm{ft}) /(10.50 \mathrm{ft})\right) \\
& \mathrm{q}_{\mathrm{tveu}-\text {-er }}=4.039 \mathrm{ksf}
\end{aligned}
$$

Factored Net Equivalent Uniform Vertical Bearing Stress

$$
\begin{aligned}
& \mathrm{q}_{\text {nveu-ser }}=\mathrm{q}_{\text {tveu-ser }}-\gamma_{\mathrm{p}}\left(\gamma_{\mathrm{e}}^{\prime} \mathrm{D}_{\mathrm{f}}\right)=4.039 \mathrm{ksf}-1.00(0.120 \mathrm{kcf}(4.333 \mathrm{ft})) \\
& \mathrm{q}_{\text {nveu-ser }}=3.519 \mathrm{ksf}
\end{aligned}
$$

## Estimated Settlement (Service I Limit State)

Using Figure 5, $\mathrm{B}^{\prime}$ ser equal to 10.50 feet, and $\mathrm{q}_{\text {nveu-ser }}$ equal to 3.519 ksf , the following estimated settlement was determined (Note that the dashed lines with open arrows in Figure 5 represent the estimation of the settlement):

Estimated Settlement $\approx 0.52$ inch
Therefore, the wall can be expected to settle approximately 0.52 inch with the soil profile noted in ADOT SF-1 policy memorandum.

Figure 1: Example of a Factored Bearing Resistance Chart for a footing of length, $\mathrm{L}^{\prime}=\mathrm{L}=150$ ft (no eccentricity) and depth of embedment, $\mathrm{D}_{\mathrm{f}}=6-\mathrm{ft}$ with base elevation of $994-\mathrm{ft}$. The resistance factor of $\phi_{b}=0.45$ is included in the strength limit state curve. " S " in the legend refers to immediate settlement.
