Subject: Showing the Existing R/W Radius Points on the ROS - Exh.'s F3 & F5

The ADOT R/W Plans Section recently sent out an announcement that Exhibits F3 and F5 were revised to add a helpful hint and to add some radius points.

This email is an accompaniment to that announcement to further elaborate on the revisions and change of policy concerning this matter.

Previously, we required that, in the existing R/W line table on Exhibit F5, the radius point for each curved segment of the existing right of way line that was being shown on the survey sheets be listed in the appropriate place in the table.

The new policy now gives you a choice. You can either continue to do it this way or utilize the new alternative. The new alternative is where you do not have to list the radius point in the existing R/W line table, but you do have to then show the calculated radius point number for each curved existing R/W line segment, with a leader pointing to the appropriate existing R/W line(s). This is illustrated on the current Exhibit sheet F3. If you choose this method, it must be done whether the existing R/W line is concentric or not with the centerline curve.
