2024 Arizona Statewide ITS Architecture Update

Contract No. CTR060470
Task Order MPD0232-23 / A1002

Final Plan of the Arizona Statewide ITS Architecture Update

APPENDICES

May 2024

Prepared for:
Arizona Department of Transportation
Multimodal Planning Division

Prepared by:

Appendices Table of Contents

Appendix A – Stakeholder List Contained in the RAD-IT Database

Stakeholder Name	Stakeholder Description
ADOT	Arizona Department of Transportation (ADOT) is the state agency responsible for the safe, efficient and cost-effective movement of people and products throughout the State of Arizona. ADOT is responsible for managing, operating, and maintaining state-owned transportation infrastructure. ADOT is comprised of multiple divisions, five of which, directly relate to this project: Enforcement and Compliance Division (ECD), Infrastructure Delivery and Operations Division (IDO), Motor Vehicle Division (MVD), Transportation Systems Management and Operations Division (TSMO) and Multimodal Planning Division (MPD). ADOT's IDO is responsible for building and maintaining Arizona's highway infrastructure. Within ADOT's Transportation Division, the state is divided into 7 regional districts: Central, Northcentral, Southcentral, Northwest, Northeast, Southwest and Southeast. TSMO was formed in 2015 to optimize performance of the existing transportation infrastructure through implementation of systems, services, and projects to preserve capacity and improve reliability and safety of the transportation system. MPD is responsible for long range planning and transportation programming including the State Transportation Improvement Program (STIP). The ECD is the law enforcement component of ADOT, and the MVD is ADOT's division that handles AZ drivers' licenses and vehicle registrations.
Archive Data Users	This stakeholder represents any user of archive data products from any archive management system. This may include individual users, computer applications, or modeling systems utilizing the archived data.
Arizona Cities and Towns	This stakeholder represents all cities and towns throughout the State of Arizona. Some of their responsibilities include: traffic operations, fire, law enforcement, public safety answering points (PSAP), maintenance, websites, and archived databases. There are many cities and towns in Arizona whose traffic management functions and infrastructure are not specifically called out in the Maricopa Association of Governments (MAG) or Pima Association of Governments (PAG) ITS Regional Architectures, but have planned or already operate signal systems or other ITS elements. This stakeholder group includes all cities and towns outside the MAG and PAG regions: • Benson• Bisbee• Bullhead City • Camp Verde• Casa Grande • Chino Valley• Clarkdale• Clifton• Colorado City• Coolidge• Cottonwood• Dewey-Humboldt• Douglas• Duncan• Eagar• Eloy• Flagstaff• Fredonia• Globe• Hayden• Holbrook• Huachuca City• Jerome• Kearny• Kingman• Lake Havasu City• Mammoth• Miami• Nogales• Page• Parker• Patagonia• Payson• Pima• Pinetop-Lakeside• Prescott• Prescott Valley• Quartzsite• Safford• Sahuarita• San Luis• Sedona• Show Low• Sierra Vista• Snowflake• Somerton• Springerville• St. Johns• Star Valley• Superior• Taylor• Thatcher• Tombstone• Tusayan• Wellton• Willcox• Williams• Winkelman• Winslow• Yuma
Arizona Counties	This stakeholder represents all counties throughout the State of Arizona. Some of their responsibilities include traffic operations, fire, law enforcement, public safety answering points (PSAP), maintenance, websites, and archived databases. There are many counties in Arizona whose traffic management functions and infrastructure are not specifically called out in the Maricopa Association of Governments (MAG) or Pima Association of Governments (PAG) ITS Regional Architectures, but have planned or already operate signal systems or other ITS elements. This stakeholder group includes the following counties: • Apache• Cochise• Coconino• Gila• Graham• Greenlee• La Paz• Mohave• Navajo• Pinal (the portion not included in MAG's ITS Regional Architecture)• Santa Cruz• Yavapai• Yuma. Several counties' traffic management functions for ITS include dynamic or automated devices for traveler information, traffic and weather data collection, driver feedback, and related actuated devices for traffic control and route guidance. Stakeholder inventory includes these elements.
Arizona Department of Environmental Quality (ADEQ)	The Arizona Department of Environmental Quality (ADEQ) has a mission to protect and enhance public health, welfare, and the environment in Arizona. Established by the Arizona Legislature in 1986 in response to growing concerns about groundwater quality, ADEQ today administers a variety of programs to improve the health and welfare of its citizens and ensures the quality of Arizona's air, land, and water resources meet healthful, regulatory standards. ADEQ is responsible for the state vehicle emissions program, including Commercial Vehicle Operations (CVO) emissions, and are also responsible for the State Implementation Plan.

Stakeholder Name	Stakeholder Description
Arizona Department of Public Safety (DPS)	The Arizona Department of Public Safety (DPS) represents highway law enforcement and is divided into 4 divisions: • Agency Support, • Criminal Investigations, • Highway Patrol and • Technical Services. DPS is responsible for ensuring the safe and expeditious use of the highway transportation system for the public and to provide assistance to local and county law enforcement agencies. DPS coordinates with Arizona Department of Transportation in these efforts. DPS also provides services and enforcement in commercial motor vehicle, tow truck, safety programs and is responsible for the air rescue and aviation services.
Arizona Division of Emergency and Military Affairs (DEMA)	The Arizona Division of Emergency and Military Affairs (DEMA) consists of the Arizona National Guard, Division of Emergency Management, and Division of Administrative Services. DEMA provides unique capabilities and services to the citizens of Arizona in three distinct roles: community, state, and federal.
Arizona MPOs and COGs	Metropolitan Planning Organizations (MPO) and Council of Governments (COG) provide leadership and guidance for regional transportation planning through building consensus and cooperative efforts. Each MPO and COG has boundaries that include cities and counties. This stakeholder represents all ITS elements owned and operated by MPOs and COGs with existing and planned ITS activities throughout the State of Arizona, that are not included in other ITS Architectures (MAG or PAG Regional ITS Architectures). All MPOs and COGs are represented by this stakeholder, including but not limited to:• Central Arizona Government (CAG)• Northern Arizona Council of Governments (NACOG)• SouthEastern Arizona Governments Organization (SEAGO)• Western Arizona Council of Governments (WACOG)• Central Yavapai Metropolitan Planning Organization (CYMPO)• Flagstaff Metropolitan Planning Organization (FMPO)• Lake Havasu Metropolitan Planning Organization (LHMPO)• Sun Corridor Metropolitan Planning Organization (SCMPO)• Sierra Vista Metropolitan Planning Organization (SVMPO)• Yuma Metropolitan Planning Organization (YMPO). Several MPOs in the state also operate transit facilities.
Arizona Tribal Strategic Partnering Team (ATSPT)	The Arizona Tribal Strategic Partnering Team (ATSPT) was established in 1999 through the efforts of the ADOT Partnering Section, ADOT Civil Rights Office, ADOT MPD, and FHWA to bring together representatives from state, tribal, federal, and local agencies to discuss tribal related transportation issues and to develop strategies through which those issues can be addressed. ATSPT's active participating agencies include ADOT, Bureau of Indian Affairs (BIA), Inter-Tribal Council of Arizona, counties, and tribes. With the adoption of the ADOT Tribal Consultation Policy, ADOT is committed to work with the tribes, communities and native nations to consult and coordinate on State and tribal transportation missions and goals.
Arizona Universities	This stakeholder represents all universities within Arizona that participate in ITS related projects, research, and/or evaluations of ITS applications. The public universities include: Arizona State University (ASU), Northern Arizona University, and University of Arizona (UofA). The UofA, ATLAS Center is involved in the SmartDrive - Connected Vehicle (formerly VII) effort involving on-board emergency response vehicles that communicate with roadside equipment to reduce crashes and support traffic incident management initiatives. The University of Arizona has also been involved in ITS research with collision avoidance systems, testing on-board RADAR and tracking systems, Real-time Hierarchically Optimized Distributed Effective Signal system (RHODES), and other ITS efforts.
AZTech	AZTech is a regional traffic management and traffic data sharing partnership (25 partners) in the Phoenix Metropolitan area that guides the application of Intelligent Transportation System (ITS) technologies for managing regional traffic. AZTech carefully integrates individual traffic management strategies and technologies for regional benefit, while preserving operational control protocols important to individual jurisdictions. The center-to-center system, whereby traffic management tools and information are shared among traffic and emergency management subsystems on a center to center basis for stakeholder agencies in real time, has become the central data-sharing system.
Bureau of Indian Affairs (BIA)	The Bureau of Indian Affairs' mission is to enhance the quality of life, to promote economic opportunity, and to carry out the responsibility to protect and improve the trust assets of American Indians, Indian tribes and Alaska Natives.

Stakeholder Name	Stakeholder Description
Electric Utility Operators	This stakeholder represents electric utilities that provide electricity through an electric power distribution network.
Electric Vehicle Charging Station Operators	This stakeholder represents operators of electric vehicle charging stations in general, and specifically those operators that own and operate electric vehicle charging stations funded under the National Electric Vehicle Infrastructure (NEVI) Formula Program.
Emergency Medical (EM) Transport Companies	Emergency Medical (EM) Contract Transport Companies are the emergency medical service providers that offer ambulance services and medical transports.
Federal Highway Administration (FHWA)	Federal Highway Administration (FHWA) has served as a funding and advisory partner in the State of Arizona throughout ITS planning and deployment spanning the '80s, '90s and into the 21st century. They are partners in AZTech, the Arizona E-Vehicle Infrastructure Integration Initiative, this Statewide ITS Architecture update, and federally funded transportation related projects in the State of Arizona.
Federal Joint Office of Energy and Transportation	The Joint Office of Energy and Transportation (Joint Office) team has deep expertise in zero-emission transportation infrastructure. The Joint Office team also helps coordinate and leverage expertise between the U.S. Department of Energy and the U.S. Department of Transportation to further progress on zero-emission transportation infrastructure. Federally funded Electric Vehicle Charging Stations are required to report prescribed usage statistics to the Joint Office at prescribed time intervals.
Federal Motor Carrier Safety Agency (FMSCA)	The Federal Motor Carrier Safety Agency (FMSCA) is an agency within the US Department of Transportation responsible for commercial vehicle operations.
Financial Institutions	This stakeholder represents financial and banking institutions that play a role in the transfer of funds for fare collection as well as for other fee-based transportation services.
GIS Mapping Designers	This stakeholder represents designers who create and update maps for use in routing and identifying longitude and latitude locations.
I-10 Corridor Coalition	Founded in 2016, the I-10 Corridor Coalition is a voluntary coalition of state Departments of Transportation that are committed to a multi-jurisdictional coordination, organized around a common agenda and facilitated through a cooperative support structure. The geographic boundary of the coalition will encompass the corridor along Interstate 10 throughout the states of California, Arizona, New Mexico, and Texas. Projects will be developed through this partnership in future years which will impact commercial vehicle operations, freight services, security, and connected vehicles.
Independent School Districts	This stakeholder represents all public-school districts throughout the State of Arizona. The districts have been included primarily for their role in emergency situations (e.g., evacuations during which school buses are utilized).
International Fuel Tax Association (IFTA)	This is an international clearinghouse (US and Canada) designed to allocate fuel taxes between US states and Canadian provinces for motor carrier activities across jurisdictional lines, in accordance with the International Fuel Tax Agreement.

Stakeholder Name	Stakeholder Description
International Registration Plan, Inc.	IRP, Inc. serves as the repository for IRP supporting the many functions of the IRP Agreement including various committees and services. The governance of IRP, Inc. is provided by a Board of Directors, which is made up of IRP Administrators from the 4 IRP regions across the U.S. and Canada. The International Registration Plan (IRP) is an agreement providing registration reciprocity among the States of the United States, the District of Columbia and Provinces of Canada providing for payment of license fees on the basis of fleet distance operated in the various jurisdictions. A unique feature of the IRP is that even though fees are paid to multiple jurisdictions through the base jurisdiction, only one license plate and registration cab card is required for each vehicle.
Maricopa Association of Governments (MAG)	The Maricopa Association of Governments (MAG) is the Council of Governments (COG) that serves as the regional Metropolitan Planning Organization (MPO) for the Phoenix area. MAG developed and provides updates to the MAG Regional ITS Architecture which is a related architecture of this Statewide ITS Architecture update. MAG projects and ITS operations can be found in the MAG Regional ITS Architecture at: http://www.consystec.com/mag/web/
Maricopa County Department of Transportation (MCDOT)	The Maricopa County Department of Transportation (MCDOT) plans, designs, constructs, and maintains roadways primarily within the unincorporated areas of the county. MCDOT partnered with ADOT in several projects that have a statewide impact related to emerging technologies such as connected vehicles (previously recognized as Vehicle Infrastructure Integration (V-II). MCDOT is a stakeholder in the MAG Regional ITS Architecture, however, they are also included in the Arizona Statewide ITS Architecture to show statewide coordination efforts for evacuation, statewide emergency management services, and projects involving ADOT. MCDOT's ITS projects and all operations can be found in the MAG Regional ITS Architecture at: http://www.consystec.com/mag/web/
Media	This stakeholder represents owners/operators of communications media including television, radio, newspapers, and internet news sources.
Mexico Governmental Agencies	This stakeholder represents all of the government agencies within the country of Mexico that handle traffic operations, maintenance of roads, emergency operations, border inspection, and clearance operations.
Mohave County Public Works	Mohave County is located in the northwestern corner of the state. As of the 2020 census, its population was just over 213,000. The county seat is Kingman. Mohave County contains parts of Grand Canyon National Park and Lake Mead National Recreation Area and all of the Grand Canyon–Parashant National Monument. The Kaibab, Fort Mojave and Hualapai Indian Reservations also lie within the county. Mohave County Public Works develops, manages, and maintains county roads and transportation infrastructure throughout the county.
National Oceanic Atmospheric Administration (NOAA)	The National Oceanic and Atmospheric Administration (NOAA) is a federal agency focused on the condition of the oceans and the atmosphere. It plays several roles in providing local weather services. They also receive Road Weather Information System (RWIS) data from ADOT.
Pima Association of Governments (PAG)	Pima Association of Governments (PAG) is the regional Metropolitan Planning Organization (MPO) for Southern Arizona. PAG includes Pima County, the Cities of South Tucson and Tucson, the Towns of Marana, Oro Valley, and Sahuarita, the Pascua Yaqui Tribe, and the Tohono O'Odham Nation. PAG developed and maintains the PAG Regional ITS Architecture.
Private Commercial Carriers	This stakeholder represents private owners of commercial vehicles that carry goods throughout the State of Arizona.
Private Container System Owners	This stakeholder represents owners of private container systems that pass from port to port using the interstate corridor systems.

Stakeholder Name	Stakeholder Description
Private Information Service Providers	This stakeholder represents local, regional, and national information service providers (e.g., Navigator, INRIX, HERE, Google Transit, WAZE, etc.) that provide travel information to the public. This information is delivered through subscription services or general broadcast information including: internet sites, hand-held devices with internet access, and service bureaus (e.g., AZ511). ADOT currently subscribes to 3rd party data to post travel times content to roadside DMS and the AZ511 website.
Public and Private Transit Providers	This stakeholder represents Northern Arizona Intergovernmental Public Transportation Authority (NAIPTA dba Mountain Line), Central Yavapai Metropolitan Planning Organization (CYMPO), Yuma County Intergovernmental Public Transportation Authority (YCIPTA), and all transit providers throughout Arizona. It also consists of public or private transit providers that offer transit, commuter, and event management services, including local fixed-route shuttle buses, paratransit services, and dial-a-ride services.
Rail Organizations	This stakeholder represents owners of private rail systems.
State of Arizona	This stakeholder represents the State of Arizona and its administrative and legislative offices.
State of California	This stakeholder represents the California Department of Public Safety-California Highway Patrol (CHP) and the California Department of Transportation (Caltrans).
State of Nevada	This stakeholder represents the Nevada Department of Public Safety (DPS) - Nevada Highway Patrol and the Nevada Department of Transportation (NDOT).
State of New Mexico	This stakeholder represents the New Mexico Department of Public Safety (DPS) - New Mexico Highway Patrol and New Mexico Department of Transportation (NMDOT).
State of Utah	This stakeholder represents the State of Utah Department of Public Safety (DPS) - Highway Patrol and the Utah Department of Transportation (UDOT).
Time and Data Sources	This stakeholder represents any service that provides time, location tracking, and real time services such as Google Map.
Travelers	This stakeholder represents the public at large.
Tribal Governments - Statewide	This stakeholder represents all tribal governments within the State of Arizona. There are 22 federally recognized Native American Tribes, Communities and Nations with reservation land and their own ITS systems: • Ak-Chin Indian Community• Cocopah Indian Tribe• Colorado River Indian Tribes• Fort McDowell Yavapai Nation• Fort Mojave Indian Tribe• Fort Yuma Quechan Indian Tribe• Gila River Indian Community• Havasupai Indian Tribe• Hopi Tribe• Hualapai Tribe• Kaibab Band of Paiute Indians• Navajo Nation• Pascua Yaqui Tribe• Pueblo of Zuni• Salt River Pima-Maricopa Indian Community• San Carlos Apache Tribe• San Juan Southern Paiute Tribe• Tohono O'odham Nation• Tonto Apache Tribe• White Mountain Apache Tribe• Yavapai-Apache Nation• Yavapai-Prescott Indian Tribe
US Customs and Border Protection (CBP)	US Customs and Border Protection (CBP) represents two of the Department of Homeland Security's (DHS) largest and most complex components, with a priority mission of keeping terrorists and their weapons out of the US. It also has a responsibility for securing the border and facilitating lawful international trade and travel while enforcing hundreds of US laws and regulations, including immigration and drug laws. The CBP also provides updated wait times for reaching the primary inspection booth when in traffic queues.
US Immigration and Customs Enforcement (ICE)	US Immigration and Customs Enforcement is the principal investigative arm of the US Department of Homeland Security (DHS) and the second largest investigative agency in the federal government.

Appendix B – ITS Inventory Contained in the RAD-IT Database (sorted by stakeholder name)

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
ADOT	ADOT 511 IVR	The interactive voice response (IVR) telephone system providing statewide traveler information for the State of Arizona. The 511 IVR system may include travel time information, construction information, roadway incidents, and special events.	Existing	Transportation Information Center
ADOT	ADOT 511 IVR	The interactive voice response (IVR) telephone system providing statewide traveler information for the State of Arizona. The 511 IVR system may include travel time information, construction information, roadway incidents, and special events.	Existing	Traveler Information Voice System
ADOT	ADOT 511 Website	ADOT's www.az511.gov website provides statewide traveler information systems for the State of Arizona. The system includes freeway video images, travel time information, and roadway incidents. Public access to the information is provided via the internet.	Existing	Emergency Management Center
ADOT	ADOT 511 Website	ADOT's www.az511.gov website provides statewide traveler information systems for the State of Arizona. The system includes freeway video images, travel time information, and roadway incidents. Public access to the information is provided via the internet.	Existing	Maint and Constr Management Center
ADOT	ADOT 511 Website	ADOT's www.az511.gov website provides statewide traveler information systems for the State of Arizona. The system includes freeway video images, travel time information, and roadway incidents. Public access to the information is provided via the internet.	Existing	Other Emergency Management Centers
ADOT	ADOT 511 Website	ADOT's www.az511.gov website provides statewide traveler information systems for the State of Arizona. The system includes freeway video images, travel time information, and roadway incidents. Public access to the information is provided via the internet.	Existing	Transportation Information Center

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
ADOT	ADOT Asset Management Systems	ADOT Asset Management Systems represent the systems that support decision-making for maintenance, upgrade, and operation of physical transportation assets. Asset management integrates and includes the pavement management systems, bridge management systems, and other systems that inventory and manage the highway infrastructure and other transportation-related assets. The types of assets that are inventoried and managed will vary, and may include the maintenance and construction vehicles and equipment as well as 'soft' assets such as human resources and software. Asset management systems monitor the condition, performance, and availability of the infrastructure and evaluate and prioritize alternative reconstruction, rehabilitation, and maintenance strategies.	Existing	Asset Management System
ADOT	ADOT AZ 511 App	ADOT has an official App that provides real time information to travelers about unplanned major events that are impacting traffic so informed decisions can be made to avoid lengthly delays or potentially hazerdous situations.	Existing	Media
ADOT	ADOT AZ Crash Information System (ACIS)	ADOT Arizona Crash information System (ACIS - previously FDM Safety Data Mart) is a safety data mart that represents the systems' user's ability to access secure ALISS archived data and geocodes ALISS crash data.. The general interface provided allows a broad range of users (e.g. planners, researchers, analysts, operators) and their systems (e.g. databases, models, analytical tools, user interface devices) to acquire data and analyses results from the archive. The information for this database comes largely from law enforcement agencies throughout the state of Arizona.	Existing	Archived Data User System
ADOT	ADOT Communications PIO	Public Information Officers (PIO) communicate real-time information about highway conditions to the traveling public and manage ADOT's social media platforms. PIOs provide oversight to the AZ511 system and can add messages to the Dynamic Message Signs to communicate travel information to the public.	Existing	Emergency Management Center
ADOT	ADOT Crash Reporting Information System (CRIS)	The Crash Reporting Information System (CRIS) is both a data archive for ADOT and, much of the information is shared with external database systems. The primary source of data for this database is the State Highway Log (SHL) system. The data is not "real time". The information is used for planning, highway safety projects, etc. CRIS is part of the ADOT Motor Vehicle Division (MVD) Database, and replaces the crash database system formerly known as Accident Location Identification Surveillance System (ALISS).	Existing	Archived Data System

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
ADOT	ADOT Crash Reporting Information System (CRIS)	The Crash Reporting Information System (CRIS) is both a data archive for ADOT and, much of the information is shared with external database systems. The primary source of data for this database is the State Highway Log (SHL) system. The data is not "real time". The information is used for planning, highway safety projects, etc. CRIS is part of the ADOT Motor Vehicle Division (MVD) Database, and replaces the crash database system formerly known as Accident Location Identification Surveillance System (ALISS).	Existing	Emergency Management Center
ADOT	ADOT CV Roadside Equipment	This element represents roadside equipment that primarily enables Connected Vehicle applications and functionality. CV Roadside Equipment (RSE) may also facilitate improved autonomous vehicle operations and functionality. CV Roadside Equipment communicates data and information with vehicles in proximity to the equipment. CV Roadside Equipment may also communicate with other pertinent CV Roadside Equipment. Dedicated Short Range Communications (DSRC) is an open-source protocol for wireless communication, similar in some respects to WiFi. DSRC for Connected and Autonomous Vehicle (CAV) operations and applications facilitates highly secure, high-speed, low latency, all-weather wireless communications between vehicles and between vehicles and the infrastructure. The United States Federal Communications Commission (FCC) dedicated bandwidth in the 5.9 GHz radio spectrum to be used for vehicle safety and other mobility applications. Connected Vehicle applications may implement crash avoidance functionality, Transit Signal Priority (TSP), and other safety-sensitive functions. The FCC has also granted a joint request submitted by automotive manufacturers, equipment manufacturers, and state departments of transportation to permit deployment of cellular-vehicle-to-everything (C-V2X) technology in the upper 30 MHz of spectrum in the 5.895-5.925 GHz band. This equipment typically operates from a fixed position and may be permanently deployed, and can also a portable device that is located temporarily in the vicinity of a traffic incident, road construction, or a special event. To achieve full Connected Vehicle functionality, vehicles must be equipped with corresponding on board equipment (OBE).	Planned	Connected Vehicle Roadside Equipment

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
ADOT	ADOT DEOC-Dept EM Ops Center	ADOT's Departmental Emergency Operations Center (DEOC) is used to provide direction and control of ADOT resources during declared emergencies. This function falls under TSM&O Division. They may be activated in support of the state emergency operations center or on its own. It would likely be activated during a large scale, multi day event. This element represents ADOT Emergency Preparedness and Response. (wildfires, major roadway infrastructure failures, large area evacuations, etc.)	Existing	Emergency Management Center
ADOT	ADOT DEOC-Dept EM Ops Center	ADOT's Departmental Emergency Operations Center (DEOC) is used to provide direction and control of ADOT resources during declared emergencies. This function falls under TSM&O Division. They may be activated in support of the state emergency operations center or on its own. It would likely be activated during a large scale, multi day event. This element represents ADOT Emergency Preparedness and Response. (wildfires, major roadway infrastructure failures, large area evacuations, etc.)	Existing	Other Emergency Management Centers
ADOT	ADOT DEOC-Dept EM Ops Center	ADOT's Departmental Emergency Operations Center (DEOC) is used to provide direction and control of ADOT resources during declared emergencies. This function falls under TSM&O Division. They may be activated in support of the state emergency operations center or on its own. It would likely be activated during a large scale, multi day event. This element represents ADOT Emergency Preparedness and Response. (wildfires, major roadway infrastructure failures, large area evacuations, etc.)	Existing	Other Traffic Management Centers
ADOT	ADOT DEOC-Dept EM Ops Center	ADOT's Departmental Emergency Operations Center (DEOC) is used to provide direction and control of ADOT resources during declared emergencies. This function falls under TSM&O Division. They may be activated in support of the state emergency operations center or on its own. It would likely be activated during a large scale, multi day event. This element represents ADOT Emergency Preparedness and Response. (wildfires, major roadway infrastructure failures, large area evacuations, etc.)	Existing	Traffic Management Center
ADOT	ADOT Dust Detection Software System	ADOT Dust Detection Software System receives dust detection data from dust detection sensors, processes the data and requests ADOT TOC to post messages to ADOT DMS, Variable Speed Limit signs, and other traveler information systems to warn travelers about the roadway condition. It can also directly post messages on ADOT DMS'.	Existing	Emergency Management Center

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
ADOT	ADOT Dust Detection Software System	ADOT Dust Detection Software System receives dust detection data from dust detection sensors, processes the data and requests ADOT TOC to post messages to ADOT DMS, Variable Speed Limit signs, and other traveler information systems to warn travelers about the roadway condition. Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
ADOT	ADOT ECD CVO Administration Center	ECD is a division of ADOT – It utilizes certified peace officers to enforce transportation related laws and regulations. To carry out its functions, Enforcement Services: 1) checks commercial vehicles at fixed ports of entry to the State and through mobile enforcement for credential compliance, weight compliance, and safety laws, including laws relating to the transportation of hazardous materials. 2) They inspect vehicles to ensure they are legally configured and safe to operate, and, 3) they identify stolen vehicles and vehicle parts. They do internal investigations, fraud investigations, etc. ECD has a registration compliance responsibility to monitor how long plates are in the state and they send out a welcome to Arizona letter and send officers out to do follow up to make sure residents are actually residents. The Central Permitting section of ECD has handles the permitting and routing of oversize and overweight loads that travel in Arizona.	Existing	Border Inspection Administration Center

ADOT	ADOT ECD Dispatch	ADOT ECD Dispatch uses computer-aided dispatch, the records management system, and traffic and criminal software. The team also performs non-law enforcement dispatch for the Traffic Operations Center and partners with other state agencies. ECD Dispatch provides technical and application support statewide for the safety and productivity of customers. The team administers ADOT's Spillman Flex Computer Aided Dispatch (CAD) and Records Management System (RMS). CAD is used to keep employees safe throughout the state by monitoring active incidents and employee activity in ECD's Operations Communications Center and Transportation Systems Management and Operations' Traffic Operations Center. Incident data is fed to the AZ511 system. Spillman Flex RMS is used for completing incident reports, storing citation and arrest data, collecting statistical data, evidence inventory management and auditing, equipment and asset tracking, tracking records requests and more.	Existing	Commercial Vehicle Administration Center

ADOT	ADOT TOC Data User System	ADOT TOC data user system is the system that users employ to access archived data. The general interface provided allows a broad range of users (e.g. planners, researchers, analysts, operators) and their systems (e.g. databases, models, analytical tools, user interface devices) to acquire data and analyses results from the archive.	Existing	Archived Data User System
ADOT	ADOT TOC Traffic Information Center	ADOT TOC transportation information center' collects, processes, stores, and disseminates transportation information to system operators and the traveling public. The physical object can play several different roles in an integrated ITS. In one role, the TIC provides a data collection, fusing, and repackaging function, collecting information from transportation system operators and redistributing this information to other system operators in the region and other TICs. In this information redistribution role, the TIC provides a bridge between the various transportation systems that produce the information and the other TICs and their subscribers that use the information. The second role of a TIC is focused on delivery of traveler information to subscribers and the public at large. Information provided includes basic advisories, traffic and road conditions, transit schedule information, yellow pages information, ride matching information, and parking information. The TIC is commonly implemented as a website or a web-based application service, but it represents any traveler information distribution service.	Existing	Transportation Information Center

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
ADOT	ADOT Truck Parking Availability System (TPAS)	The I-10 Truck Parking Availability System (TPAS) is a technology system that will detect, monitor, and provide real-time truck parking availability information to truck drivers, dispatchers, and other interested stakeholders. Once implemented, the system will monitor and report on the availability of truck parking spaces at public rest areas in California, Arizona, New Mexico, and Texas. The system will utilize roadside dynamic message signs, smartphone and in-cab applications, websites, and other traveler information sites, truck drivers and dispatchers can make informed parking decisions that will help improve safety, efficiency, and mobility, and reduce emissions along the I-10 corridor.	Planned	Parking Area Equipment
ADOT	ADOT Truck Parking Availability System (TPAS)	The I-10 Truck Parking Availability System (TPAS) is a technology system that will detect, monitor, and provide real-time truck parking availability information to truck drivers, dispatchers, and other interested stakeholders. Once implemented, the system will monitor and report on the availability of truck parking spaces at public rest areas in California, Arizona, New Mexico, and Texas. Planned	Traffic Management Center
ADOT	ADOT Truck Parking Equipment	Represents the Truck Parking Availability System (TPAS) Parking Area Equipment for the State of Arizona. It monitors parking lot usage and provides the information to TPAS.	Planned	Parking Area Equipment

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
ADOT	ADOT Virtual Port Technologies	This element represents virtual commercial vehicle screening technologies in the state. The technology, including cameras, weigh-in-motion scales and other in-road sensors have been installed at three of the state's highway rest areas, McGuireville, Canoa Ranch, and Sacaton Rest Areas. The commercial vehicle screening technology promotes safe and expeditious movement of vehicles, allowing ADOT Enforcement and Compliance Division (ECD) and DPS officers to focus on commercial vehicles with weight, credential, and/or safety alerts. This provides reduced traffic congestion and promotes more efficient and effective enforcement efforts.	Existing	Commercial Vehicle Check Equipment
ADOT	ADOT WIM Stations	Weigh in Motion (WIM) is the process of weighing a moving roadside vehicle using road sensors and scales. ADOT Enforcement Compliance Division (ECD) administrates the Commercial Vehicle Operations (CVO) WIM for Arizona. This includes pre-pass stations at the national ports-of-entry and weigh stations at interational ports-of-entry; WIM is also used for traffic monitoring and pavement preservation.	Existing	Commercial Vehicle Check Equipment
ADOT	ADOT Wrong Way Driver Detection System	ADOT owns and operates the ADOT Wrong Way Driver Detection System. When thermal cameras in the field are tripped by a wrong way driver (WWD), an alert is issued to the ADOT TOC operators. Once a WWD is verified by a TOC operator, the TOC operator activates a Decision Support System (DSS) that automatically changes the relevant DMS signs to warn other drivers and moves CCTV cameras to attempt to follow the WWD.	Existing	ITS Roadway Equipment
ADOT	ADOT Wrong Way Driver Detection System	ADOT owns and operates the ADOT Wrong Way Driver Detection System. When thermal cameras in the field are tripped by a wrong way driver (WWD), an alert is issued to the ADOT TOC operators. Once a WWD is verified by a TOC operator, the TOC operator activates a Decision Support System (DSS) that automatically changes the relevant DMS signs to warn other drivers and moves CCTV cameras to attempt to follow the WWD.	Existing	Other Connected Vehicle Roadside Equipment

Archive Data Users	Archive Data Users	Any user of archive data products from any archive management system. This may include individual users, computer applications, or modeling systems utilizing the archived data.	Existing	Archived Data User System
Arizona Cities and Towns	Cities and Towns Data Archive	The Cities and Town Data Archive is often referred to as the traffic database in cities. It is used primarily to store performance data, road closures, speed, construction activities, and planned events. This database is used to archive all types of traffic data.	Existing	Archived Data System
Arizona Cities and Towns	Cities and Towns Data User Systems	Cities and Towns 'Data User Systems' represents the systems users employ to access archived data from all cities and towns in Arizona. The general interface provided allows a broad range of users (e.g. planners, researchers, analysts, operators) and their systems (e.g. databases, models, analytical tools, user interface devices) to acquire data and analyses results from the archive.	Existing	Archived Data User System

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Arizona Cities and Towns	Cities and Towns EOC-EMC	Cities and Towns Emergency Management Centers and Emergency Ops Centers throughout the state.The 'Emergency Management Center' represents systems that support incident management, disaster response and evacuation, security monitoring, and other security and public safety-oriented ITS applications. It includes the functions associated with fixed and mobile public safety communications centers including public safety call taker and dispatch centers operated by police (including transit police), fire, and emergency medical services. It includes the functions associated with Emergency Operations Centers that are activated at local, regional, state, and federal levels for emergencies and the portable and transportable systems that support Incident Command System operations at an incident. This Center also represents systems associated with towing and recovery, freeway service patrols, HAZMAT response teams, and mayday service providers. It manages sensor and surveillance equipment used to enhance transportation security of the roadway infrastructure (including bridges, tunnels, interchanges, and other key roadway segments) and the public transportation system (including transit vehicles, public areas such as transit stops and stations, facilities such as transit yards, and transit infrastructure such as rail, bridges, tunnels, or bus guideways). It provides security/surveillance services to improve traveler security in public areas not a part of the public transportation system.It monitors alerts, advisories, and other threat information and prepares for and responds to identified emergencies. It coordinates emergency response involving multiple agencies with peer centers. It stores, coordinates, and utilizes emergency response and evacuation plans to facilitate this coordinated response. Emergency situation information including damage assessments, response status, evacuation information, and resource information are shared The Emergency Management Center also provides a focal point for coordination of the emergency and evacuation information that is provided to the traveling public, including wide-area alerts when immediate public notification is warranted.It tracks and manages emergency vehicle fleets using real-time road network status and routing information from the other centers to aid in selecting the emergency vehicle(s) and routes, and works with other relevant centers to tailor traffic control to support emergency vehicle ingress and egress, implementation of special traffic restrictions and closures, evacuation traffic control plans, and other special strategies that adapt the transportation system to better meet the unique demands of an emergency.	Existing	Emergency Management Center

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Arizona Cities and Towns	Cities and Towns Fiber Backbone	This element represents all city and town main fiber backbones, in which the cities and towns are responsible for and/or planning within their jurisdictional boundaries.	Existing	Data Distribution System
Arizona Cities and Towns	Cities and Towns ITS Field Equipment	Cities and Towns 'ITS Roadway Equipment' represents the ITS equipment that is distributed on and along the roadway that monitors and controls traffic and monitors and manages the roadway itself. This physical object includes traffic detectors, environmental sensors, traffic signals, highway advisory radios, dynamic message signs, CCTV cameras and video image processing systems, grade crossing warning systems, and ramp metering systems. Lane management systems and barrier systems that control access to transportation infrastructure such as roadways, bridges and tunnels are also included. This object also provides environmental monitoring including sensors that measure road conditions, surface weather, and vehicle emissions. Work zone systems including work zone surveillance, traffic control, driver warning, and work crew safety systems are also included.	Existing	ITS Roadway Equipment
Arizona Cities and Towns	Cities and Towns ITS Field Equipment	Cities and Towns 'ITS Roadway Equipment' represents the ITS equipment that is distributed on and along the roadway that monitors and controls traffic and monitors and manages the roadway itself. This physical object includes traffic detectors, environmental sensors, traffic signals, highway advisory radios, dynamic message signs, CCTV cameras and video image processing systems, grade crossing warning systems, and ramp metering systems. Lane management systems and barrier systems that control access to transportation infrastructure such as roadways, bridges and tunnels are also included. This object also provides environmental monitoring including sensors that measure road conditions, surface weather, and vehicle emissions. Work zone systems including work zone surveillance, traffic control, driver warning, and work crew safety systems are also included.	Existing	Wayside Equipment
Arizona Cities and Towns	Cities and Towns MCO Dispatch	Counties, cities and municipal public works divisions that provide maintenance and construction for roadways throughout the State of Arizona.	Existing	Maint and Constr Management Center
Arizona Cities and Towns	Cities and Towns MCO Vehicles	Cities and Towns maintenance, construction and signal repair vehicles.	Existing	Basic Maint and Constr Vehicle
Arizona Cities and Towns	Cities and Towns MCO Vehicles	Cities and Towns maintenance, construction and signal repair vehicles.	Existing	Maint and Constr Vehicle OBE

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Arizona Cities and Towns	Cities and Towns Police and Fire Dispatch	Cities and Towns police department and fire department dispatch representings the dispatching function of all cities and towns throughout the state of Arizona, existing and planned.	Existing	Emergency Management Center
Arizona Cities and Towns	Cities and Towns Police and Fire Vehicles	Cities and Towns police and fire emergency vehicles.	Existing	Emergency Vehicle OBE
Arizona Cities and Towns	Cities and Towns Public Works	Cities and towns public works represents the maintenance division for streets and traffic signals.	Existing	Maint and Constr Management Center
Arizona Cities and Towns	Cities and Towns Public Works	Cities and towns public works represents the maintenance division for streets and traffic signals.	Existing	Surface Transportation Weather Service
Arizona Cities and Towns	Cities and Towns Public Works Vehicles	Cities and Towns public work vehicles provide maintenance and operations services to the City's public works division. This element represents both existing and planned vehicles and, may include vehicle location and time data source for monitoring vehicle location, time that services required and other maintenance and operations performance measures.	Existing	Basic Maint and Constr Vehicle
Arizona Cities and Towns	Cities and Towns Public Works Vehicles	Cities and Towns public work vehicles provide maintenance and operations services to the City's public works division. This element represents both existing and planned vehicles and, may include vehicle location and time data source for monitoring vehicle location, time that services required and other maintenance and operations performance measures.	Existing	Maint and Constr Vehicle OBE

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Arizona Cities and Towns	Cities and Towns TIC and Website	The Cities and Towns Website represents existing and planned websites. Websites can serve as a transportation information center subsystem and can contain event information, traffic information, maintenance and construction information, and weather information. At the broadest services, this element would serve as a Transportation Information Center' (TIC): collects, processes, stores, and disseminates transportation information to system operators and the traveling public. The physical object can play several different roles in an integrated ITS. In one role, the TIC provides a data collection, fusing, and repackaging function, collecting information from transportation system operators and redistributing this information to other system operators in the region and other TICs. In this information redistribution role, the TIC provides a bridge between the various transportation systems that produce the information and the other TICs and their subscribers that use the information. The second role of a TIC is focused on delivery of traveler information to subscribers and the public at large. Information provided includes basic advisories, traffic and road conditions, transit schedule information, yellow pages information, ride matching information, and parking information. The TIC is commonly implemented as a website or a web-based application service, but it represents any traveler information distribution service.	Existing	Transportation Information Center
Arizona Cities and Towns	Cities and Towns TMC-TOC	Cities and Towns Traffic Operations Center (TOC) manages traffic signal operations and may perform other traffic management activities. This ITS element represents all cities and counties existing and planned for in the future. Some cities and towns plan to connect with other local traffic ops centers, including but not limited to, ADOTs statewide TOC, local police, local fire, emergency operations centers and transit services. This element could be existing or planned.	Existing	Traffic Management Center
Arizona Cities and Towns	Cities and Towns Train Wayside Alert	Arizona Cities and Towns Train Wayside Alert system represents wayside equipment that sends alerts regarding an approaching train for at grade road crossings. The city of Casa Grande has over 100 trains a day that cross roadways at the same grade as the road. Other existing crossings include Flagstaff,	Existing	Wayside Equipment
Arizona Cities and Towns	Cities and Towns Transit Dispatch	Cities and towns transit dispatch such as Kingman Area Regional Transit (KART), Yuba, etc. includes both existing and planned transit dispatch, provides fixed transit services throughout the state.	Existing	Transit Management Center

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Arizona Cities and Towns	Cities and Towns Transit Vehicles	Cities and Towns have fixed transit routes and paratransit. This represents buses and vehicles connected to the Transit Dispatch Centers.	Existing	Basic Transit Vehicle
Arizona Cities and Towns	Cities and Towns Transit Vehicles	Cities and Towns have fixed transit routes and paratransit. This represents buses and vehicles connected to the Transit Dispatch Centers.	Existing	Transit Vehicle OBE
Arizona Cities and Towns	Cities and Towns Weather Flood Alerts	Cities and towns weather flood alerts represents weather systems that report flooding conditions and will automatically trigger an alert to notify motorists when the wash is flowing at a specific height. This elements is both existing and planned for those cities and towns that want to implement these systems in the future.	Existing	ITS Roadway Equipment
Arizona Cities and Towns	Cities and Towns Wireless Radio	Cities and Towns wireless radio communications	Existing	Data Distribution System
Arizona Counties	County 911 PSAPs	Public Safety Answering Point (PSAPs) for 911 emergency response call answering in the State of Arizona.	Existing	Emergency Telecommunications System
Arizona Counties	County Data Archive	County Data Archive stores raw traffic count data collected throughout the region. Assists with fulfilling Highway Performance Monitoring System (HPMS) federal requirements to collect current traffic counts (and other info) for all functionally classified roads.	Existing	Archived Data System
Arizona Counties	County Data User Systems	County 'Data User Systems' represents the systems users employ to access archived data. The general interface provided allows a broad range of users (e.g. planners, researchers, analysts, operators) and their systems (e.g. databases, models, analytical tools, user interface devices) to acquire data and analyses results from the archive.	Existing	Archived Data User System
Arizona Counties	County EMC-EOC	County Emergency Management (EMC) and Operations Center (EOC) with connections to TMCs, ADEM, BLM, statewide EOCs, and Sheriff's Offices	Existing	Emergency Management Center
Arizona Counties	County Flood Warning System	County flood warning systems include automated weather stations, ALERT, CCTV, and all existing and planned County rainfall sensors and monitoring systems that connects to a flood control central computer. This system may send information to traffic management centers or, may provided roadside to roadside information to motorists. It will provide information about floods that could impact traffic on highways.	Existing	ITS Roadway Equipment

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Arizona Counties	County ITS Field Equipment	County owned and operated field equipment: DMS, traffic signal, driver feedback speed limit signs, CCTV, detection, Road Weather Information System and, Highway Advisory Radio (HAR).	Existing	ITS Roadway Equipment
Arizona Counties	County Mobile App	County has an innovative custom mobile app that allows road closure and opening notifications from field devices. Auto e-mail and social media notifications are disseminated.	Existing	Media
Arizona Counties	County Public Works	County Public Works Department serves as the maintenance and construction management center that monitors and manages roadway infrastructure construction and maintenance activities. Public works provides the following functions: engineering, ERACE, facilities management, fleet services and equipment maintenance, improvement districts, parks, roads, survey and traffic control.	Existing	Maint and Constr Management Center
Arizona Counties	County Public Works Vehicles	County maintenance vehicles and construction equipment that belong to the Public Works Department and largely equipped with AVL.	Existing	Basic Maint and Constr Vehicle
Arizona Counties	County Public Works Vehicles	County maintenance vehicles and construction equipment that belong to the Public Works Department and largely equipped with AVL.	Existing	Maint and Constr Vehicle OBE
Arizona Counties	County Radio Systems	County two-way radio systems operating usually on frequency 150.	Existing	Data Distribution System
Arizona Counties	County Sheriff Dispatch	This element represents the County Sheriff's Office and their associated dispatch center.	Existing	Emergency Management Center
Arizona Counties	County Sheriffs Vehicles	County Sheriffs' Offices or other law enforcement vehicles.	Existing	Emergency Vehicle OBE
Arizona Counties	County TMC-TOC	County Traffic Management Center and traffic operations centers with connections to the county EOCs/EMCs, ADEM, BLM, and Sheriff’s Office.	Existing	Traffic Management Center
Arizona Counties	County Transit Kiosks	This element represents all county kiosks used by travelers to view bus scheduling times or to purchase transit passes, such as theMountain Line Kiosks.	Existing	Traveler Support Equipment
Arizona Counties	County Website and NIXLE	County website contains event information, traffic information, maintenance and construction information, and weather information.	Existing	Other Transit Management Centers
Arizona Counties	County Website and NIXLE	County website contains event information, traffic information, maintenance and construction information, and weather information.	Existing	Transportation Information Center

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Arizona Department of Environmental Quality (ADEQ)	ADEQ Arizona Emissions Management	Arizona Emissions Management communicates with MVD by providing emissions testing data. They also alert the traffic management center on "poor" air quality days so that they can alert the public through DMS.	Existing	Emissions Management Center
Arizona Department of Public Safety (DPS)	Arizona Criminal Justice Information System	Arizona Criminal Justice Information System (ACJIS) is a network maintained by the Arizona Department of Public Safety that is available to authorized local, state, and federal criminal justice agencies and serves as a conduit to the National Criminal Information Center (NCIC)	Existing	Commercial Vehicle Administration Center
Arizona Department of Public Safety (DPS)	Arizona Criminal Justice Information System	Arizona Criminal Justice Information System (ACJIS) is a network maintained by the Arizona Department of Public Safety that is available to authorized local, state, and federal criminal justice agencies and serves as a conduit to the National Criminal Information Center (NCIC)	Existing	Other CV Administration Centers
Arizona Department of Public Safety (DPS)	Arizona Criminal Justice Information System	Arizona Criminal Justice Information System (ACJIS) is a network maintained by the Arizona Department of Public Safety that is available to authorized local, state, and federal criminal justice agencies and serves as a conduit to the National Criminal Information Center (NCIC)	Existing	Other Emergency Management Centers
Arizona Department of Public Safety (DPS)	Commercial Vehicle Enforcement Partnership System	Represents system that utilized by the officers of the commercial vehicle enforcement partnership program to send commercial vehicle check-in information from Arizona's ports-of-entry at interstate and international borders to ADOT and DPS central system.	Planned	Commercial Vehicle Check Equipment
Arizona Department of Public Safety (DPS)	Commercial Vehicle Enforcement Partnership System	Represents system that utilized by the officers of the commercial vehicle enforcement partnership program to send commercial vehicle check-in information from Arizona's ports-of-entry at interstate and international borders to ADOT and DPS central system.	Planned	Emergency Management Center
Arizona Department of Public Safety (DPS)	DPS Backhaul Communications System	The core microwave communications backbone that makes the bureau’s communications work possible. This is a state-wide asset supporting communications to federal, tribal, state and local government agencies. The Backhaul communications system is being upgraded from analog to digital microwave.NOTE: Rural DMS rely on this system for Communications to the ADOT TOC.	Existing	Data Distribution System

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Arizona Department of Public Safety (DPS)	DPS Backhaul Communications System	The core microwave communications backbone that makes the bureau's communications work possible. This is a state-wide asset supporting communications to federal, tribal, state and local government agencies. The Backhaul communications system is being upgraded from analog to digital microwave.NOTE: Rural DMS rely on this system for Communications to the ADOT TOC.	Existing	Other Data Distribution Systems
Arizona Department of Public Safety (DPS)	DPS Central Communications Center	The DPS Central Communications Center is the dispatch center for State Highway Patrol and Freeway Service Patrol (FSP). The Department of Public Safety serves as the state law enforcement for highways, they also manage the FSP and the communications and work with FAA on licensing. Arizona DPS Freeway Service Patrol are dispatched here. This program is funded by ADOT, managed by DPS and serves to provide assistance to motorists on freeways requiring support or to help with tires, calling for tow, removing roadway debris, assisting officers at collision scenes, road and ramp closures, stalled vehicles, minor collisions or other incidents.	Existing	Emergency Management Center
Arizona Department of Public Safety (DPS)	DPS Central Communications Center	The DPS Central Communications Center is the dispatch center for State Highway Patrol and Freeway Service Patrol (FSP). The Department of Public Safety serves as the state law enforcement for highways, they also manage the FSP and the communications and work with FAA on licensing. Arizona DPS Freeway Service Patrol are dispatched here. This program is funded by ADOT, managed by DPS and serves to provide assistance to motorists on freeways requiring support or to help with tires, calling for tow, removing roadway debris, assisting officers at collision scenes, road and ramp closures, stalled vehicles, minor collisions or other incidents.	Existing	Other Emergency Management Centers
Arizona Department of Public Safety (DPS)	DPS Central Communications Center	The DPS Central Communications Center is the dispatch center for State Highway Patrol and Freeway Service Patrol (FSP). The Department of Public Safety serves as the state law enforcement for highways, they also manage the FSP and the communications and work with FAA on licensing. Arizona DPS Freeway Service Patrol are dispatched here. This program is funded by ADOT, managed by DPS and serves to provide assistance to motorists on freeways requiring support or to help with tires, calling for tow, removing roadway debris, assisting officers at collision scenes, road and ramp closures, stalled vehicles, minor collisions or other incidents.	Existing	Other Traffic Management Centers

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Arizona Department of Public Safety (DPS)	DPS Central Communications Center	The DPS Central Communications Center is the dispatch center for State Highway Patrol and Freeway Service Patrol (FSP). The Department of Public Safety serves as the state law enforcement for highways, they also manage the FSP and the communications and work with FAA on licensing. Arizona DPS Freeway Service Patrol are dispatched here. This program is funded by ADOT, managed by DPS and serves to provide assistance to motorists on freeways requiring support or to help with tires, calling for tow, removing roadway debris, assisting officers at collision scenes, road and ramp closures, stalled vehicles, minor collisions or other incidents.	Existing	Traffic Management Center
Arizona Department of Public Safety (DPS)	DPS Commercial Vehicle Enforcement	The DPS Commercial Vehicle Division's mission is to assure the safety of the motoring public by enforcing the Federal Carrier Safety Regulations. Primary functions include inspections, weighing and traffic enforcement. Commercial Vehicle Information Exchange collects snapshots for interstate and intrastate carriers, vehicles, and drivers. CVO Administration interfaces with SAFER for interstate snapshot exchange and distributes snapshots to other states.	Existing	Commercial Vehicle Administration Center
Arizona Department of Public Safety (DPS)	DPS Commercial Vehicle Enforcement	The DPS Commercial Vehicle Division's mission is to assure the safety of the motoring public by enforcing the Federal Carrier Safety Regulations. Primary functions include inspections, weighing and traffic enforcement. Commercial Vehicle Information Exchange collects snapshots for interstate and intrastate carriers, vehicles, and drivers. CVO Administration interfaces with SAFER for interstate snapshot exchange and distributes snapshots to other states.	Existing	Enforcement Center
Arizona Department of Public Safety (DPS)	DPS Console Interface (Other LE)	The interface between DPS Dispatch and all other law enforcement agencies, local dispatch and emergency dispatch throughout the state.	Existing	Other Emergency Management Centers
Arizona Department of Public Safety (DPS)	DPS Data Archive	DPS has a database archive that is maintained in house at DPS as a confidential archive in order to preserve law enforcement security.	Existing	Archived Data System
Arizona Department of Public Safety (DPS)	DPS Data User Systems	'Archived Data User System' represents the systems users employ to access archived data. The general interface provided allows a broad range of users (e.g. planners, researchers, analysts, operators) and their systems (e.g. databases, models, analytical tools, user interface devices) to acquire data and analyses results from the archive.	Existing	Archived Data User System

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Arizona Department of Public Safety (DPS)	DPS HazMat Team	The DPS HazMat Team deals with hazards on transportation systems to assure the safety of the motoring public in the state of Arizona.	Existing	Emergency Management Center
Arizona Department of Public Safety (DPS)	DPS Network Operations Center - NOC	The DPS NOC is the central consolidation point for all public safety radio communications services on the DPS maintained network. Radio traffic from the communication site infrastructure throughout the state is routed in and out of the NOC to over 10 dispatch centers serving multiple state agencies.	Existing	Emergency Management Center
Arizona Department of Public Safety (DPS)	DPS Network Operations Center - NOC	The DPS NOC is the central consolidation point for all public safety radio communications services on the DPS maintained network. Radio traffic from the communication site infrastructure throughout the state is routed in and out of the NOC to over 10 dispatch centers serving multiple state agencies.	Existing	ITS Communications Equipment
Arizona Department of Public Safety (DPS)	DPS Network Operations Center - NOC	The DPS NOC is the central consolidation point for all public safety radio communications services on the DPS maintained network. Radio traffic from the communication site infrastructure throughout the state is routed in and out of the NOC to over 10 dispatch centers serving multiple state agencies.	Existing	Traffic Management Center
Arizona Department of Public Safety (DPS)	DPS Radio System	DPS Radio system that brings communications from the radios in the field to the backhaul.	Existing	Data Distribution System
Arizona Department of Public Safety (DPS)	DPS Radio System	DPS Radio system that brings communications from the radios in the field to the backhaul.	Existing	Other Data Distribution Systems
Arizona Department of Public Safety (DPS)	DPS RMA Vehicles	DPS Roadside Motorist Assistance (RMA) Vehicles	Existing	Emergency Vehicle OBE
Arizona Department of Public Safety (DPS)	DPS Roadside Safety Inspection	A laptop based system to conduct roadside safety inspections by DPS	Existing	Commercial Vehicle Check Equipment
Arizona Department of Public Safety (DPS)	DPS Roadside Safety Inspection	A laptop based system to conduct roadside safety inspections by DPS	Existing	Enforcement Center
Arizona Department of Public Safety (DPS)	DPS Vehicles	DPS Patrol Vehicles. Includes the subscriber on-board equipment (OBE) or radios used to communicate on the DPS radio system.	Existing	Emergency Vehicle OBE

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Arizona Department of Public Safety (DPS)	DPS Wireless Systems Bureau	A Bureau under the Technical Services Division of DPS, the Wireless Systems Bureau is an essential in-house support function responsible for the design, coordination, construction, and maintenance services for statewide radio, voice and data telecommunications systems. This bureau is responsible for DPS's Backhaul Communications. (DPS Wireless runs the whole microwave backbone, design, construct and maintain as well as track the system for operations).	Existing	Other Maint and Constr Mgmt Centers
Arizona Division of Emergency and Military Affairs (DEMA)	DEMA CRT - HazMat Response Team	The Certified Response Team (CRT) handles after-hours emergency response responsibilities for the Arizona Department of Emergency and Military Affairs (DEMA). The CRT Coordinator assists in the management of CRT under the direction of the Response Branch Manager. In cooperation with the Response Branch Manager, the CRT Duty Officer receives emergency alerts, issues warnings and instructions to the public, and coordinates with local emergency officials. CRT Duty Officers and Deputy Duty Officers are entrusted to: ==> activate the State Emergency Operations Center (SEOC) as directed; ==> provide 24/7/365 customer service to DEMA's federal, state, local and tribal emergency response partners; and ==> staff the SEOC after hours as needed.	Planned	Emergency Management Center
Arizona Division of Emergency and Military Affairs (DEMA)	DEMA CRT - HazMat Response Team	The Certified Response Team (CRT) handles after-hours emergency response responsibilities for the Arizona Department of Emergency and Military Affairs (DEMA). The CRT Coordinator assists in the management of CRT under the direction of the Response Branch Manager. In cooperation with the Response Branch Manager, the CRT Duty Officer receives emergency alerts, issues warnings and instructions to the public, and coordinates with local emergency officials. CRT Duty Officers and Deputy Duty Officers are entrusted to: ==> activate the State Emergency Operations Center (SEOC) as directed; ==> provide 24/7/365 customer service to DEMA's federal, state, local and tribal emergency response partners; and ==> staff the SEOC after hours as needed.	Planned	Traffic Management Center
Arizona Division of Emergency and Military Affairs (DEMA)	DEMA Data Archive	The traffic database for DEMA which assists in coordinating State emergency preparedness, response, recovery and mitigation efforts to recue the impacts of disasters on persons, property and ecomonies of a specific community. Archives raw data collected throughout the region.	Existing	Archived Data System

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Arizona Division of Emergency and Military Affairs (DEMA)	DEMA Data User Systems	Data User Systems' represents the systems users employ to access archived data. The general interface provided allows a broad range of users (e.g. planners, researchers, analysts, operators) and their systems (e.g. databases, models, analytical tools, user interface devices) to acquire data and analyses results from the archive.	Existing	Archived Data User System
Arizona Division of Emergency and Military Affairs (DEMA)	DEMA Emergency Alert System	DEMA Emergency Alert System provides state and local authorities with the ability to provide emergency information to the general public via broadcast stations, cable and wireless cable systems. DEMA coordinates with the National Weather Service, the Department of Public Safety (DPS), and the Arizona Broadcaster's Association to ensure that the Emergency Alerting System is functioning and reaching all intended recipients.	Existing	Alerting and Advisory System
Arizona Division of Emergency and Military Affairs (DEMA)	DEMA Enforcement	The Arizona Division of Emergency Management (ADEM) is a division within the Arizona Department of Emergency and Military Affairs (DEMA). ADEM prepares and coordinates emergency services and the efforts of governmental agencies to reduce the impact of disaster on persons and property.	Existing	Enforcement Center
Arizona Division of Emergency and Military Affairs (DEMA)	DEMA Enforcement	The Arizona Division of Emergency Management (ADEM) is a division within the Arizona Department of Emergency and Military Affairs (DEMA). ADEM prepares and coordinates emergency services and the efforts of governmental agencies to reduce the impact of disaster on persons and property.	Existing	Other Emergency Management Centers
Arizona Division of Emergency and Military Affairs (DEMA)	DEMA National Guard Vehicles	National Guard Vehicles are dispatched by Arizona DEMA during extreme emergencies.	Existing	Emergency Vehicle OBE
Arizona Division of Emergency and Military Affairs (DEMA)	DEMA SEOC Arizona DEM Military Affairs	The State of Arizona's Emergency Operations Center is used to manage emergencies and disaster response. They interact with other states during an emergency. They use WebEOC for incident management tracking and communications. They coordinate all county EOC activity, etc... They also have their own paging system "Communicator NXT" for emergency notifications during emergencies to responders - including state agencies (i.e., ADOT, DPS, etc.). The NXT system is a broadcasting telephone system.	Existing	Emergency Management Center

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Arizona Division of Emergency and Military Affairs (DEMA)	DEMA WebEOC System	This is a web based incident management system used for incident command (IC) when a statewide emergency has been declared and DEMA is the IC. There are 5 state agency users and six counties in Arizona that use this system along with the State Emergency Operations Center. The system is not integrated yet with surrounding states but, there are plans to integrate the WebEOC systems in the future. This system tracks your planning cycle, resources, location, finances, situation report, etc... (A request comes in from a county; ADEM receives the request, communicates to the appropriate response agency and responds back that the situation is handled).	Existing	Emergency Telecommunications System
Arizona Division of Emergency and Military Affairs (DEMA)	DEMA WebEOC System	This is a web based incident management system used for incident command (IC) when a statewide emergency has been declared and DEMA is the IC. There are 5 state agency users and six counties in Arizona that use this system along with the State Emergency Operations Center. The system is not integrated yet with surrounding states but, there are plans to integrate the WebEOC systems in the future. This system tracks your planning cycle, resources, location, finances, situation report, etc... (A request comes in from a county; ADEM receives the request, communicates to the appropriate response agency and responds back that the situation is handled).	Existing	Other Emergency Management Centers
Arizona MPOs and COGs	MPO-COG Data User Systems	MPO-COG Data User Systems' represents the systems users employ to access archived data from Metropolitan Planning Organizations and/or Council of Government organizations in Arizona. The general interface provided allows a broad range of users (e.g. planners, researchers, analysts, operators) and their systems (e.g. databases, models, analytical tools, user interface devices) to acquire data and analyses results from the archive.	Existing	Archived Data User System
Arizona MPOs and COGs	MPO-COG Planning Traffic Database	The traffic database for Metropolitan Planning Organizations (MPO) and Council of Governments (COG). This element archives raw traffic count data collected throughout the region. Assists with fulfilling Highway Performance Monitoring System (HPMS) federal requirements to collect current traffic counts (and other info) for all functionally classified roads.	Existing	Archived Data System

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Arizona MPOs and COGs	MPO-COG Planning Traffic Database	The traffic database for Metropolitan Planning Organizations (MPO) and Council of Governments (COG). This element archives raw traffic count data collected throughout the region. Assists with fulfilling Highway Performance Monitoring System (HPMS) federal requirements to collect current traffic counts (and other info) for all functionally classified roads.	Existing	Other Data Sources
Arizona Tribal Strategic Partnering Team (ATSPT)	ATTP Tribal Coordination Website	The Arizona Tribal Transportation Partnership (formerly ATSPT) site that contains resource information for tribal representatives. This website was developed by ADOT to support coordination efforts and to improve State-Tribal intergovernmental relations through resource information sharing. It is designed to be a central location for state-tribal transportation partnerships, projects, activities, groups, links, and other related information.	Existing	Transportation Information Center
Arizona Universities	State Universities Data Archives	Arizona Universities participate in various ITS projects. This ITS element reflects their transportation data archive database. Other examples include: UofA, ATLAS Center is involved in the SmartDrive - Connected Vehicle (formerly VII) effort involving on-board emergency response vehicles communicating with roadside equipment to cut down on crashes and support traffic incident management initiatives. University of Arizona Tucson has been involved in ITS research with collision avoidance systems, testing on-board RADAR and tracking systems and Real-time Hierarchically Optimized Distributed Effective Signal system (RHODES) and other ITS throughout decades.	Existing	Archived Data System
Arizona Universities	State Universities Data Archives	Arizona Universities participate in various ITS projects. This ITS element reflects their transportation data archive database. Other examples include: UofA, ATLAS Center is involved in the SmartDrive - Connected Vehicle (formerly VII) effort involving on-board emergency response vehicles communicating with roadside equipment to cut down on crashes and support traffic incident management initiatives. University of Arizona Tucson has been involved in ITS research with collision avoidance systems, testing on-board RADAR and tracking systems and Real-time Hierarchically Optimized Distributed Effective Signal system (RHODES) and other ITS throughout decades.	Existing	Other Data Sources

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Arizona Universities	State Universities Data User Systems	Universities 'Data User Systems' represents the systems users employ to access archived data. The general interface provided allows a broad range of users (e.g. planners, researchers, analysts, operators) and their systems (e.g. databases, models, analytical tools, user interface devices) to acquire data and analyses results from the archive.	Existing	Archived Data User System
AZTech	AZTech RADS Data Archive	AZTech partners, including the Arizona Department of Transportation (ADOT) and the Maricopa County Department of Transportation (MCDOT), archive data generated by their ITS programs. Continued emphasis on regional transportation operations inspired AZTech leadership to develop a Regional Archived Data System (RADS) that consolidates ITS information from systems throughout the Valley, stores it in a centralized archived data server, and makes it available for a variety of stakeholders via a web interface.	Existing	Archived Data System
AZTech	AZTech RADS Data Archive	AZTech partners, including the Arizona Department of Transportation (ADOT) and the Maricopa County Department of Transportation (MCDOT), archive data generated by their ITS programs. Continued emphasis on regional transportation operations inspired AZTech leadership to develop a Regional Archived Data System (RADS) that consolidates ITS information from systems throughout the Valley, stores it in a centralized archived data server, and makes it available for a variety of stakeholders via a web interface.	Existing	Traffic Management Center
AZTech	AZTech RADS Data User System	AZTech partners, including the Arizona Department of Transportation (ADOT) and the Maricopa County Department of Transportation (MCDOT), archive data generated by their ITS programs. Continued emphasis on regional transportation operations inspired AZTech leadership to develop a Regional Archived Data System (RADS) that consolidates ITS information from systems throughout the Valley, stores it in a centralized archived data server, and makes it available for a variety of stakeholders via a web interface.	Existing	Archived Data User System

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
AZTech	AZTech Regional Info System (ARIS)	The AZTech Regional Information System (ARIS) is a regional ITS tool in the Phoenix Arizona area that provides real-time incident notification and intelligently assimilates incident-centric traffic information in support of traffic management, during an incident within a zone identified by the user. The ARIS system is part of the Maricopa Regional ITS Architecture. It has been designed based on the needs of local jurisdictions. Upon notification, ARIS automatically assimilates a range of useful information related to the particular incident and presents the information in a web-based "tactical screen".	Existing	Transportation Information Center
AZTech	AZTech Traffic Ops Center	AZTech™ partners, including the Arizona Department of Transportation (ADOT) and the Maricopa County Department of Transportation (MCDOT), facilitate operations of the AZTech Traffic Operations Center. This center is an "other traffic Management Center" for the statewide ITS Architecture because it performs a sharing rather than controlling of information function. It also supports regional traffic management strategies by providing vital transportation information for managing traffic in the Phoenix Valley but, doesn't manage statewide applications.	Existing	Other Traffic Management Centers
Bureau of Indian Affairs (BIA)	BIA Western Regional Website	The website for the Southwestern Region of the Bureau of Indian Affairs. Contains traffic information as well as scheduled maintenance and construction activities for the smaller tribes in the Region. http://www.kstrom.net/isk/maps/az/azmap.html	Not Planned	Transportation Information Center
Electric Utility Operators	Electric Utilities	This Element represents electric utilities that provide power to electric vehicle charging stations.	Existing	Electric Utility
Electric Vehicle Charging Station Operators	Electric Vehicle Charging Stations	This inventory element represents electric vehicle charging stations located in the state of Arizona. The Electric Charging Station provides access to electric vehicle supply equipment that is used to charge hybrid and all-electric vehicles. This includes public charging stations that support consumers, workplace charging stations, and fleet charging stations using plug in (level 1, 2, fast charge, etc.) or inductive charging methods.	Planned	Electric Charging Station
Emergency Medical (EM) Transport Companies	Emergency Medical Transport/Ambulances	Public and private emergency medical service providers that offer ambulance services and medical transports.	Existing	Emergency Vehicle OBE

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Federal Joint Office of Energy and Transportation	Electric Vehicle Charging Analytics and Reporting Tool (EV-ChART)	The Joint Office of Energy and Transportation maintains the Electric Vehicle Charging Analytics and Reporting Tool (EV-ChART), which provides a centralized hub for submitting electric vehicle (EV) charging infrastructure data directed by the Federal Highway Administration (23 CFR 680.1121) EV-ChART will provide a streamlined data submission process and an integrated set of analytic tools, connect to other data sources, and empower data sharing and access across stakeholders, including the public. Any data shared publicly will be aggregated and anonymized to stay in accordance with 23 CFR 680.	Existing	Electric Charging Management Center
Federal Motor Carrier Safety Agency (FMSCA)	Safety Fitness Electronic Record (SAFER)	SAFER provides carrier, vehicle, and driver safety and credential information to fixed and mobile roadside inspection stations. This information will allow the roadside inspector to select vehicles and/or drivers for inspection based on the number of prior carrier inspections, as well as historical carrier, vehicle, and driver safety information.	Existing	Commercial Vehicle Administration Center
Federal Motor Carrier Safety Agency (FMSCA)	Safety Fitness Electronic Record (SAFER)	SAFER provides carrier, vehicle, and driver safety and credential information to fixed and mobile roadside inspection stations. This information will allow the roadside inspector to select vehicles and/or drivers for inspection based on the number of prior carrier inspections, as well as historical carrier, vehicle, and driver safety information.	Existing	CVO Information Requestor Center
Federal Motor Carrier Safety Agency (FMSCA)	Safety Fitness Electronic Record (SAFER)	SAFER provides carrier, vehicle, and driver safety and credential information to fixed and mobile roadside inspection stations. This information will allow the roadside inspector to select vehicles and/or drivers for inspection based on the number of prior carrier inspections, as well as historical carrier, vehicle, and driver safety information.	Existing	Enforcement Center
Financial Institutions	Financial Institution	Any organization that handles electronic fund transfer requests to enable the transfer of funds from the user of a transportation related service to the provider of the same service.	Existing	Financial Center
Financial Institutions	Payment Administration Center	The Payment Administration Center provides general payment administration capabilities and supports the electronic transfer of funds from the customer to the transportation system operator or other service provider. Charges can be recorded for tolls, vehicle-mileage charging, congestion charging, or other goods and services. It supports traveler enrollment and collection of both pre-payment and post-payment transportation fees in coordination with the financial infrastructure supporting electronic payment transactions.	Planned	Payment Administration Center

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Financial Institutions	Traveler Card-Smartcard	Traveler Card enables the actual transfer of electronic information from the user of a service (I.e. a traveler) to the provider of the service. This may include the transfer of funds through means of an electronic payment instrument. The device, like a smart card, may also hold and update the traveler's information such as personal profiles or trip histories.	Planned	Payment Device
Financial Institutions	Traveler Card-Smartcard	Traveler Card enables the actual transfer of electronic information from the user of a service (I.e. a traveler) to the provider of the service. This may include the transfer of funds through means of an electronic payment instrument. The device, like a smart card, may also hold and update the traveler's information such as personal profiles or trip histories.	Planned	Traveler Card
GIS Mapping Designers	Map Update System	Map updating systems (can be Google Earth, local power companies or other GIS sources).	Planned	Map Update System
Independent School Districts	Independent School District Bus Dispatch	Dispatch function for each of the independent school districts in the Region. Includes radio communication with school buses.	Existing	Transit Management Center
Independent School Districts	Independent School District Buses	Represents buses and any ITS equipment, such as mobile data terminals, on buses owned and operated by the independent school districts. May come equipped with security measures.	Existing	Basic Transit Vehicle
Independent School Districts	Independent School District Buses	Represents buses and any ITS equipment, such as mobile data terminals, on buses owned and operated by the independent school districts. May come equipped with security measures.	Existing	Transit Vehicle OBE
International Fuel Tax Association (IFTA)	International Fuel Tax Agreement (IFTA) Clearinghouse	This is a national clearinghouse designed to allocate fuel taxes between multiple states for motor carrier activities across jurisdictional lines, in accordance with the International Fuel Tax Agreement.	Existing	Commercial Vehicle Administration Center

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
International Registration Plan, Inc.	Commercial Vehicle Driver and Vehicle Verification Systems	International Registration Plan (IRP) develops and maintains many information systems that facilitate the electronic exchange of driver, vehicle, and identity information between organizations. Some of the driver related systems include the Commercial Driver's License Information System (CDLIS), Problem Driver Pointer System (PDPS), and the State to State Verification Service (S2S). The National Motor Vehicle Title Information System (NMVTIS) is among the vehicle related systems that IRP, Inc. maintains. These and other IRP, Inc. maintained systems are used by the Arizona Department of Transportation Motor Vehicle Division (MVD) to transmit, query, and verify driver and vehicle information to and from other jurisdictions in order to process driver and vehicle transactions.	Existing	Archived Data System

IRP Inc. is responsible for the international carrier plan that helps the carrier decide where to locate their home base for apportioned' registration fees to each state.	Existing	Other Payment Administration Centers
Maricopa Association of Governments (MAG)	MAG Data User Systems	MAG Data User Systems' represents the systems users employ to access archived data. The general interface provided allows a broad range of users (e.g. planners, researchers, analysts, operators) and their systems (e.g. databases, models, analytical tools, user interface devices) to acquire data and analyses results from the archive.	Existing	Archived Data User System
Maricopa Association of Governments (MAG)	MAG Planning Traffic Database	The traffic database for MAG. Archives raw traffic count data collected throughout the region. Assists with fulfilling Highway Performance Monitoring System (HPMS) federal requirements to collect current traffic counts (and other info) for all functionally classified roads. This center provides the information to other stakeholders for planning.	Existing	Archived Data System
Maricopa Association of Governments (MAG)	MAG Planning Traffic Database	The traffic database for MAG. Archives raw traffic count data collected throughout the region. Assists with fulfilling Highway Performance Monitoring System (HPMS) federal requirements to collect current traffic counts (and other info) for all functionally classified roads. This center provides the information to other stakeholders for planning.	Existing	Other Data Sources
Maricopa Association of Governments (MAG)	MAG RCN Fiber	Maricopa Association of Governments Regional Communications Network (RCN) fiber for communications.	Existing	Data Distribution System
Maricopa County Department of Transportation (MCDOT)	Maricopa County EOC	Maricopa County EOC as services pertains to statewide emergency operations.	Existing	Emergency Management Center

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Maricopa County Department of Transportation (MCDOT)	MCDOT Service Monitoring Sys for Connected Vehicles	The Service Monitor System represents one or more center-based systems that provide monitoring, management and control services necessary to other applications and/or devices operating within the Connected Vehicle Environment. These support services enable other applications to provide transportation services.	Existing	Service Monitor System
Media	Local Print and Broadcast Media	Includes the local newspapers and the local TV and radio stations not specifically called out in other ITS Architectures in the State of Arizona	Existing	Media
Media	Wide Area Alerting Systems	Wide Area Alerting Systems are used throughout the state to notify the public when there is an emergency often through a rapid notification system used to contact the public by telephone during times of emergency. Through a reverse 911 system, residents receive a recorded message in English and Spanish notifying them of the nature of the emergency, and what steps they should take to eliminate risks associated with the emergency. Any public safety agency can activate the system, which can be used for emergency incidents that pose a danger to life or property. Potential uses include emergencies such as major fires, floods, public safety threats, hazardous materials spills, police incidents, and endangered children or elderly persons.	Existing	Alerting and Advisory System
Media	Wide Area Alerting Systems	Wide Area Alerting Systems are used throughout the state to notify the public when there is an emergency often through a rapid notification system used to contact the public by telephone during times of emergency. Through a reverse 911 system, residents receive a recorded message in English and Spanish notifying them of the nature of the emergency, and what steps they should take to eliminate risks associated with the emergency. Any public safety agency can activate the system, which can be used for emergency incidents that pose a danger to life or property. Potential uses include emergencies such as major fires, floods, public safety threats, hazardous materials spills, police incidents, and endangered children or elderly persons.	Existing	Transportation Information Center
Mexico Governmental Agencies	Mexico Customs and Border Patrol	This element represents the border patrol agency at the border crossings in Mexico, who also handles customs when entering into Mexico	Existing	Emergency Management Center
Mexico Governmental Agencies	Mexico Public Safety	This element represents the public safety providers (police, fire and EMS) in the cities where border crossings exist and, in the surrounding Mexican States.	Existing	Emergency Management Center

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Mexico Governmental Agencies	Mexico Regional Maintenance Section	This element represents the maintenance function in border crossing cities inside of Mexico that would coordinate with Arizona and New Mexico (District 1 and 2).	Existing	Maint and Constr Management Center
Mexico Governmental Agencies	Mexico Regional TMC	The state of Sonora has a TMC and the ability to enter data into their database for road closures, incidents and accidents in Mexico. This element represents the regional traffic management center located in bordering cities of Mexico that would coordinate traffic information or operations with Arizona and New Mexico.	Existing	Traffic Management Center
Mohave County Public Works	Mohave County V2I Enabled Rural Highway Traffic Control Signs	Vehicle-to-Infrastructure (V2I) Enabled Rural Highway Traffic Control Signs will deploy roadside equipment that employs vehicle-to-infrastructure functions and communications to deliver either (1) stop sign gap assist (SSGA) - warning drivers of potential collisions at stop sign intersections or (2) curve speed warning (CSW) – alert provided to drivers approaching a curve at a speed that may be too high for safe travel through that curve.	Planned	Connected Vehicle Roadside Equipment
National Oceanic Atmospheric Administration (NOAA)	NOAA _National Weather Service	The National Oceanic and Atmospheric Administration (NOAA) is a federal agency focused on the condition of the oceans and the atmosphere. It plays several roles in local weather information.	Existing	Transportation Information Center
National Oceanic Atmospheric Administration (NOAA)	NOAA _National Weather Service	The National Oceanic and Atmospheric Administration (NOAA) is a federal agency focused on the condition of the oceans and the atmosphere. It plays several roles in local weather information.	Existing	Weather Service System
Pima Association of Governments (PAG)	PAG Data User Systems	NAU 'Data User Systems' represents the systems users employ to access archived data. The general interface provided allows a broad range of users (e.g. planners, researchers, analysts, operators) and their systems (e.g. databases, models, analytical tools, user interface devices) to acquire data and analyses results from the archive.	Existing	Archived Data User System
Pima Association of Governments (PAG)	PAG Planning Traffic Database	The traffic database for the MPOs and regional planning organizations throughout the State of Arizona. Collects traffic count information from its own field equipment and distributes traffic count information to public.	Existing	Archived Data System
Pima Association of Governments (PAG)	PAG RTDN Communications System	Pima Association of Governments (PAG's) Regional Transportation Data Network (RTDN) fiber for communications.	Existing	Data Distribution System

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Private Commercial Carriers	Commercial Vehicles	Public or private trucks that cross international or state borders and drive throughout the State of Arizona.	Existing	Commercial Vehicle OBE
Private Commercial Carriers	Driver Identification Card	Driver Identification cards represent the card or device that enables the transfer of electronic identification information for a driver. this may include license information, biometrics, and other data to identify the driver. Typically the card will be issued by a government agency (motor vehicle agency).	Planned	Driver Identification Card
Private Commercial Carriers	Fleet Management Systems	Dispatch function for Commercial Vehicle Fleets.	Existing	Fleet and Freight Management Center
Private Commercial Carriers	Freight Containers	Freight containers owned by private companies and being transported across interstates.	Existing	Freight Equipment
Private Container System Owners	Freight Containers	Freight containers owned by private companies and being transported across interstates.	Existing	Freight Equipment
Private Container System Owners	Freight Shipping System	System tracking and scheduling the movement of freight from its destination - data primarily provided by the supplier or owner of commodities shipped. Includes status of bookings made and the status of the freight's movement.	Existing	Intermodal Customer System
Private Information Service Providers	Private Transit Routing Service Provider	Third party routing service, such as Google Transit, that uses transit route and schedule information to provide personalized transit trip planning.	Existing	Personal Information Device
Private Information Service Providers	Private Transit Routing Service Provider	Third party routing service, such as Google Transit, that uses transit route and schedule information to provide personalized transit trip planning.	Existing	Traveler Support Equipment
Private Information Service Providers	Public Private Traveler Information	This system represents national information service providers (Navigator, INRIX, HERE, Google Transit, WAZE, etc.) that provide travel information to the public. ADOT currently subscribes to 3rd party data to post travel times content to roadside DMS and the AZ511 website.	Existing	Data Distribution System
Private Information Service Providers	Public Private Traveler Information	This system represents national information service providers (Navigator, INRIX, HERE, Google Transit, WAZE, etc.) that provide travel information to the public. ADOT currently subscribes to 3rd party data to post travel times content to roadside DMS and the AZ511 website.	Existing	Transportation Information Center

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Private Information Service Providers	Social Media and Networking	Subscription based services operated by private providers that provide an option for real-time traveler information dissemination examples of services that include Waze, FaceBook and Twitter.	Existing	Media
Private Information Service Providers	Social Media and Networking	Subscription based services operated by private providers that provide an option for real-time traveler information dissemination examples of services that include Waze, FaceBook and Twitter.	Existing	Social Media
Public and Private Transit Providers	Local Dial-A-Ride Transit Dispatchers	Dispatch center for the paratransit services provided by local jurisdictions for citizens who are ADA-certified, persons with disabilities, and seniors throughout the state of Arizona where services are provided.	Existing	Transit Management Center
Public and Private Transit Providers	Local Dial-A-Ride Transit Vehicles	Represents the ITS equipment installed on the transit vehicles that are owned and operated by local dial-a-ride services. Capabilities may include Automated Vehicle Location (AVL) or, it may not.	Existing	Basic Transit Vehicle
Public and Private Transit Providers	Local Dial-A-Ride Transit Vehicles	Represents the ITS equipment installed on the transit vehicles that are owned and operated by local dial-a-ride services. Capabilities may include Automated Vehicle Location (AVL) or, it may not.	Existing	Transit Vehicle OBE
Public and Private Transit Providers	NAIPTA (dba Mountain Line) Bus Arrival System	Mountain Line Transit in Flagstaff has the ability to post arrival times and bus locations on their website. This element represents the ability to provide that information to remote travelers.	Planned	Personal Information Device
Public and Private Transit Providers	NAIPTA (dba Mountain Line) Bus Arrival System	Mountain Line Transit in Flagstaff has the ability to post arrival times and bus locations on their website. This element represents the ability to provide that information to remote travelers.	Planned	Transit Management Center
Public and Private Transit Providers	NAIPTA (dba Mountain Line) Bus Arrival System	Mountain Line Transit in Flagstaff has the ability to post arrival times and bus locations on their website. This element represents the ability to provide that information to remote travelers.	Planned	Traveler Support Equipment
Public and Private Transit Providers	NAIPTA (dba Mountain Line) ITS Field Equipment	NAIPTA owned and operated field equipment: DMS, transit detection, CCTV, transit preemption.	Existing	ITS Roadway Equipment
Public and Private Transit Providers	NAIPTA (dba Mountain Line) Paratransit	The Mountain Line paratransit service provides dial-a-ride services for ADA eligible passengers.	Existing	Transit Management Center
Public and Private Transit Providers	NAIPTA (dba Mountain Line) Paratransit Vehicles	Paratransit vehicles for Mountain Line in the Flagstaff region.	Existing	Basic Transit Vehicle

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Public and Private Transit Providers	NAIPTA (dba Mountain Line) Paratransit Vehicles	Paratransit vehicles for Mountain Line in the Flagstaff region.	Existing	Transit Vehicle OBE
Public and Private Transit Providers	NAIPTA (dba Mountain Line) Transit Buses	Transit buses for Mountain Line and Mountain Link Transit, Flagstaff area. The Mountain Link also serves Northern Arizona University (NAU). These buses either have or are in the process of receiving Next Bus notification capabilities.	Existing	Basic Transit Vehicle
Public and Private Transit Providers	NAIPTA (dba Mountain Line) Transit Buses	Transit buses for Mountain Line and Mountain Link Transit, Flagstaff area. The Mountain Link also serves Northern Arizona University (NAU). These buses either have or are in the process of receiving Next Bus notification capabilities.	Existing	Transit Vehicle OBE
Public and Private Transit Providers	NAIPTA (dba Mountain Line) Transit Data Archive	Northern Arizona Intergovernmental Public Transportation. The transit database for public transportation planning organizations throughout the northern State of Arizona. Collects transit information and distributes.	Existing	Archived Data System
Public and Private Transit Providers	NAIPTA (dba Mountain Line) Transit Management Center	NAIPTA Transit Management Center operates all of the Mountain Line, Mountain Link Transit and Mountain Lift services, they provide fixed and paratransit services to the Flagstaff area, Coconino county and to the Arizona Northern University NAU. The transit authority boundaries are consistent with the FMPO boundaries.	Existing	Archived Data User System
Public and Private Transit Providers	NAIPTA (dba Mountain Line) Transit Management Center	NAIPTA Transit Management Center operates all of the Mountain Line, Mountain Link Transit and Mountain Lift services, they provide fixed and paratransit services to the Flagstaff area, Coconino county and to the Arizona Northern University NAU. The transit authority boundaries are consistent with the FMPO boundaries.	Existing	Transit Management Center
Public and Private Transit Providers	NAIPTA (dba Mountain Line) Website and FLGRide	Website for Flagstaff Mountain Line Transit. NAIPTA also has an app that provides transit information and texting capabilities called FLGRide.	Existing	Transportation Information Center
Public and Private Transit Providers	Transit Providers Dispatch (Public and Private)	This transit provider represents public, private and commuter transit services throughout the state of Arizona. Could also represent Greyhound buses.	Existing	Archived Data User System
Public and Private Transit Providers	Transit Providers Dispatch (Public and Private)	This transit provider represents public, private and commuter transit services throughout the state of Arizona. Could also represent Greyhound buses.	Existing	Transit Management Center
Public and Private Transit Providers	Transit Providers Vehicles (Public and Private)	Public, private and commuter transit buses	Existing	Basic Transit Vehicle

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Public and Private Transit Providers	Transit Providers Vehicles (Public and Private)	Public, private and commuter transit buses	Existing	Transit Vehicle OBE
Public and Private Transit Providers	YCAT Buses	Buses and Dial-a-Ride Services for YCAT. YCAT shares information with Police, Fire and Yuma County EOC. Planned for the buses is AVL. Right now, only two of the buses will have AVL - for next bus arrival services.	Existing	Basic Transit Vehicle
Public and Private Transit Providers	YCAT Buses	Buses and Dial-a-Ride Services for YCAT. YCAT shares information with Police, Fire and Yuma County EOC. Planned for the buses is AVL. Right now, only two of the buses will have AVL - for next bus arrival services.	Existing	Transit Vehicle OBE
Public and Private Transit Providers	YCAT Kiosks	Next Bus Arrival for YCAT and travel information Kiosks - Next Bus Arrival is planned for use at Yuma Palms and Arizona Western College (AWC). Travel information kiosks are available at all bus stops but they are static.	Planned	Traveler Support Equipment
Public and Private Transit Providers	YCAT Transit Passes	YCAT has smartcards for pass purchases online.	Existing	Payment Device
Public and Private Transit Providers	YCAT Transit Passes	YCAT has smartcards for pass purchases online.	Existing	Traveler Card
Public and Private Transit Providers	YCAT Transit Passes	YCAT has smartcards for pass purchases online.	Existing	Traveler Support Equipment
Public and Private Transit Providers	YCAT Website	YCAT posts transit information, Google transit trip planning and fare purchasing on-line through their webpage.	Existing	Transportation Information Center
Public and Private Transit Providers	Yuma County Area Transit (YCAT)	The Yuma County Intergovernmental Public Transportation Authority (YCIPTA) provides 17+ buses. Yuma County Area Transit (YCAT) fixed route and Greater Yuma Area Dial-A-Ride demand responsive bus service throughout southwestern Yuma County including the cities of Yuma, San Luis, Somerton, Town of Wellton, Cocopah Indian Reservation and unincorporated communities of Yuma County, including Gadsden, Fortuna Foothills and Ligurta. YCAT also provides service into Winterhaven, CA and on the Quechan/Fort Yuma Indian Reservation. YCAT provides transit services - Monday through Friday 5:50 a.m. and 7:30 p.m. with limited evening service from Arizona Western College and Northern Arizona University and on Saturday between 9:30 a.m. and 6:30 p.m. YCAT shares information with Police, Fire and Yuma County EOC.	Existing	Archived Data User System

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects

Existing	Transit Management Center
Rail Organizations	Rail Grade Wayside Warning Systems	This element represents train interface equipment (usually) maintained and operated by the railroad and (usually) physically located at or near a roadway/railroad grade crossing. While both passive and active warning systems are used, active warning systems dominate. No track in the State of Arizona is capable of supporting high-speed trains.	Existing	ITS Roadway Equipment
Rail Organizations	Rail Grade Wayside Warning Systems	This element represents train interface equipment (usually) maintained and operated by the railroad and (usually) physically located at or near a roadway/railroad grade crossing. While both passive and active warning systems are used, active warning systems dominate. No track in the State of Arizona is capable of supporting high-speed trains.	Existing	Wayside Equipment

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Rail Organizations	Railroad Operations Center	This element represents the (usually) centralized control point for a substantial segment of a freight railroad's operations and maintenance activities. It is roughly the railroad equivalent to a highway Traffic Operations Center (TOC). It is the source and destination of information that can be used to coordinate rail and highway traffic management and maintenance operations. It is also the source and destination for incident, incident response, disaster, or evacuation information that is exchanged with an Emergency Management Center.	Existing	Rail Operations Center
State of Arizona	Arizona Administrative Office of the Courts	The Arizona Constitution authorizes an administrative director and staff to assist the Chief Justice with administrative duties. Under the direction of the Chief Justice, the administrative director and the staff of the Administrative Office of the Courts (AOC) provide the necessary support for the supervision and administration of all state courts. The AOC is comprised of eight divisions: Executive Office, Administrative Services, Adult Probation Services Division, Certification and Licensing Division, Court Services Division, Dependent Children's Services Division, Education Services Division, Information Technology Division, and Juvenile Justice Services Division.	Planned	Commercial Vehicle Administration Center
State of Arizona	Arizona Administrative Office of the Courts	The Arizona Constitution authorizes an administrative director and staff to assist the Chief Justice with administrative duties. Under the direction of the Chief Justice, the administrative director and the staff of the Administrative Office of the Courts (AOC) provide the necessary support for the supervision and administration of all state courts. The AOC is comprised of eight divisions: Executive Office, Administrative Services, Adult Probation Services Division, Certification and Licensing Division, Court Services Division, Dependent Children's Services Division, Education Services Division, Information Technology Division, and Juvenile Justice Services Division.	Planned	Emergency Management Center
State of Arizona	Arizona Administrative Office of the Courts	The Arizona Constitution authorizes an administrative director and staff to assist the Chief Justice with administrative duties. The AOC is comprised of eight divisions: Executive Office, Administrative Services, Adult Probation Services Division, Certification and Licensing Division, Court Services Division, Dependent Children's Services Division, Education Services Division, Information Technology Division, and Juvenile Justice Services Division.	Planned	Other CV Administration Centers

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
State of Arizona	Arizona State Office of Highway Safety	The Arizona Governor's Office of Highway Safety (GOHS) is the focal point for highway safety issues in Arizona.GOHS provides leadership by developing, promoting, and coordinating programs that influence public and private policy by increasing public awareness of highway safety issues. Funded programs target speed reduction, decreasing impaired driving, increasing seat belt and child safety seat usage as well as motorcycle safety awareness and driver distractions that cause traffic fatalities and injuries on our streets and highways.	Planned	Archived Data System
State of California	Caltrans ITS Field Equipment	Represents ITS Field Devices owned and Operated by CalTran in the areas that border Arizona and coordinate with Arizona ITS systems in managing the transportation systems serving the bordering areas.	Planned	ITS Roadway Equipment
State of California	Caltrans TMC	Caltrans Traffic Management Center at the borders of the state of California.	Existing	Other Traffic Management Centers
State of California	Caltrans Truck Parking Availability System	The Caltrans Truck Parking Availability System can manage large commercial vehicle parking availability for drivers and notify them when a space is available.	Existing	Parking Management Center
State of California	Caltrans Truck Parking Availability System	The Caltrans Truck Parking Availability System can manage large commercial vehicle parking availability for drivers and notify them when a space is available.	Existing	Transportation Information Center
State of California	CHP Dispatch	The dispatch functions for the California State Highway Patrol - law enforcement.	Existing	Emergency Management Center
State of Nevada	NDOT ITS Field Equipment	There are DMS operated by NDOT that border Arizona and are activated when wind speed threshold is reached on US 93 on the Nevada side of the highway.	Existing	ITS Roadway Equipment
State of Nevada	NDOT TOC - FAST TMC	NDOT's southern Nevada TMC is called FAST and is located in Las Vegas. FAST is operated by the southern Nevada RTC MPO. There are DMS operated by NDOT that border Arizona and are activated when wind speed threshold is reached on US 93 on the Nevada side of the highway.	Existing	Other Traffic Management Centers
State of Nevada	NDOT TOC - FAST TMC	NDOT's southern Nevada TMC is called FAST and is located in Las Vegas. FAST is operated by the southern Nevada RTC MPO. There are DMS operated by NDOT that border Arizona and are activated when wind speed threshold is reached on US 93 on the Nevada side of the highway.	Existing	Traffic Management Center
State of Nevada	Nevada State Police Dispatch	The dispatch functions for the Nevada State Highway Patrol.	Existing	Emergency Management Center

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
State of New Mexico	New Mexico ITS Field Equipment	Represents ITS Field Devices owned and Operated by New Mexico in the areas that border Arizona and coordinate with Arizona ITS systems in managing the transportation systems serving the bordering areas.	Planned	ITS Roadway Equipment
State of New Mexico	New Mexico State Police Dispatch	The dispatch functions for the New Mexico State Police.	Existing	Emergency Management Center
State of New Mexico	New Mexico Statewide TMC	The New Mexico Statewide ITS Architecture connects County Traffic Operations Center, NMDOT Districts 1, 5 and 6 as well as the Statewide TMC to ADOT Statewide TMC.	Existing	Other Traffic Management Centers
State of New Mexico	New Mexico Statewide TMC	The New Mexico Statewide ITS Architecture connects County Traffic Operations Center, NMDOT Districts 1, 5 and 6 as well as the Statewide TMC to ADOT Statewide TMC.	Existing	Traffic Management Center
State of New Mexico	New Mexico Truck Parking Availability System	The New Mexico Truck Parking Availability System can manage large commercial vehicle parking availability for drivers and notify them when a space is available.	Existing	Parking Management Center
State of New Mexico	New Mexico Truck Parking Availability System	The New Mexico Truck Parking Availability System can manage large commercial vehicle parking availability for drivers and notify them when a space is available.	Existing	Transportation Information Center
State of Utah	Utah State Police Dispatch	The dispatch function for the Utah State Police	Existing	Emergency Management Center
State of Utah	Utah Statewide TMC	The Utah ITS Architecture connects the statewide TMC in Utah to ADOT Statewide TOC.	Existing	Other Traffic Management Centers
Time and Data Sources	Vehicle GPS and Time Data	The 'Vehicle Location and Time Data Source' provides accurate position information for vehicle-based mobile devices. While a Global Positioning System (GPS) Receiver is the most common implementation, this physical object represents any technology that provides a position fix in three dimensions and time with sufficient accuracy. This data can be used for location through a vehicle OBE (ie for time stamping and performance monitoring).	Existing	Location and Time Data Source
Travelers	Basic Private Vehicle	Basic vehicle owned by travelers	Existing	Basic Vehicle
Travelers	Basic Private Vehicle	Basic vehicle owned by travelers	Existing	Light Vehicle OBE

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Travelers	Driver Identification Card	Driver Identification cards represent the card or device that enables the transfer of electronic identification information for a driver. this may include license information, biometrics, and other data to identify the driver. Typically the card will be issued by a government agency (motor vehicle agency).	Planned	Driver Identification Card
Travelers	Personal Information Devices for Travelers	Local, regional and national information service providers, such as Navigator, SmartRoutes, or Metro Traffic that provide travel information to the traveling public (both subscription service and general broadcast information). Includes internet sites, hand held devices (phones) with access to traffic conditions, service bureaus, etc.	Existing	Personal Information Device
Travelers	Personal Information Devices for Travelers	Local, regional and national information service providers, such as Navigator, SmartRoutes, or Metro Traffic that provide travel information to the traveling public (both subscription service and general broadcast information). Includes internet sites, hand held devices (phones) with access to traffic conditions, service bureaus, etc.	Existing	Personnel Device
Travelers	Private Vehicle OBE	Vehicles owned by travelers	Existing	Light Vehicle OBE
Travelers	Travelers	Travelers represent the public at large.	Existing	Traveler
Tribal Governments - Statewide	Tribal Data Archive	Represents the archives of data (e.g. crash records or traffic counts) performed and/or collected by tribal governments.	Existing	Archived Data System
Tribal Governments - Statewide	Tribal Data User Systems	Tribal Data User Systems' represents the systems users employ to access archived data. The general interface provided allows a broad range of users (e.g. planners, researchers, analysts, operators) and their systems (e.g. databases, models, analytical tools, user interface devices) to acquire data and analyses results from the archive.	Existing	Archived Data User System
Tribal Governments - Statewide	Tribal Fiber for Communications	Existing and planned fiber communications network for various tribal fiber communications.	Existing	Data Distribution System
Tribal Governments - Statewide	Tribal ITS Field Equipment	Tribal field equipment (signals, etc.)	Existing	ITS Roadway Equipment
Tribal Governments - Statewide	Tribal MCO Dispatch	The regional maintenance and construction (MCO) dispatch function for BIA. This agency is responsible for all roads (maintenance and construction, plowing, etc.) on all tribal land.	Existing	Maint and Constr Management Center
Tribal Governments - Statewide	Tribal MCO Vehicles	Tribal maintenance and construction vehicles and plows.	Existing	Basic Maint and Constr Vehicle

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
Tribal Governments - Statewide	Tribal MCO Vehicles	Tribal maintenance and construction vehicles and plows.	Existing	Maint and Constr Vehicle OBE
Tribal Governments - Statewide	Tribal Police and Fire Vehicles	Public safety vehicles (police, fire and EMS) owned and operated by the BIA that responds to incidents on the smaller tribes throughout the State. This is handled mostly on a tribal level (not a lot of BIA involvement).	Not Planned	Emergency Vehicle OBE
Tribal Governments - Statewide	Tribal Public Safety Dispatch	The Bureau of Indian Affairs public safety (police, fire and EMS) dispatches. This is handles mostly at a tribal level with little or no BIA involvement.	Existing	Emergency Management Center
Tribal Governments - Statewide	Tribal Public Safety Dispatch	The Bureau of Indian Affairs public safety (police, fire and EMS) dispatches. This is handles mostly at a tribal level with little or no BIA involvement.	Existing	Other Emergency Management Centers
Tribal Governments - Statewide	Tribal TMC-TOC-TIC	This element represents traffic management and transportation information from the Tribal Governments throughout the state. Much like the County, City, and Municipalities, these elements represent functions related to managing the ITS equipment and communicating to others. As each of the Tribals grow in ITS projects or specific communications we will call them out separately as needed in the Statewide Architecture database.	Planned	Traffic Management Center
Tribal Governments - Statewide	Tribal TMC-TOC-TIC	This element represents traffic management and transportation information from the Tribal Governments throughout the state. Much like the County, City, and Municipalities, these elements represent functions related to managing the ITS equipment and communicating to others. As each of the Tribals grow in ITS projects or specific communications we will call them out separately as needed in the Statewide Architecture database.	Planned	Transportation Information Center
Tribal Governments - Statewide	Tribal Transit Centers	Several of the tribes throughout the state have transit or commuter services provided. This represents those transit management centers.	Existing	Transit Management Center
Tribal Governments - Statewide	Tribal Transit Vehicles	Tribal Transit Vehicles - bus services provided through the tribes.	Existing	Basic Transit Vehicle
Tribal Governments - Statewide	Tribal Transit Vehicles	Tribal Transit Vehicles - bus services provided through the tribes.	Existing	Transit Vehicle OBE
US Customs and Border Protection (CBP)	CBP Website	This element represents the Customs Border Protection (CBP) website. It provides wait times for vehicles when crossing the international border into the US.	Existing	Transportation Information Center

Stakeholder	Element Name	Element Description	Element Status	Associated Physical Objects
US Customs and Border Protection (CBP)	POE Administration Center	(POE) Point of Entry is a 'Border Inspection Administration Center' that represents back-office systems and databases run by domestic and foreign governmental agencies responsible for the regulation of trade, and the enforcement of customs and immigration laws. These agencies include U.S. Department of Homeland Security (DHS) and its counterparts in Canada and Mexico. DHS includes components like Customs and Border Protection (CBP), Immigration and Customs Enforcement (ICE), and Transportation Security Administration (TSA). Other agencies include secondary trade agencies (e.g., U.S. Food and Drug Administration, U.S. Department of Agriculture, other USDOT departments, etc.), and agencies from other trading nations. The systems they manage coordinate activities related to the border crossings. These systems support import/export cargo processing and enforcement operations at the border, including programs such as FAST, Automated Commercial Environment (ACE), Nexus (Canada), SENTRI (Mexico), and US-VISIT.	Existing	Border Inspection Administration Center
US Customs and Border Protection (CBP)	POE Data Archive	POE DATA ARchive is the archive data for wait times and other data at the Port of Entry (POE), border protection agency. The 'Archived Data System' collects, archives, manages, and distributes data generated from ITS sources for use in transportation administration, policy evaluation, safety, planning, performance monitoring, program assessment, operations, and research applications. The data received is formatted and tagged with attributes that define the data source, conditions under which it was collected, data transformations, and other information (i.e. meta data) necessary to interpret the data. The archive can fuse ITS generated data with data from non-ITS sources and other archives to generate information products utilizing data from multiple functional areas, modes, and jurisdictions. The archive prepares data products that can serve as inputs to federal, state, and local data reporting systems.	Existing	Archived Data System
US Customs and Border Protection (CBP)	POE Data User and ISP Systems	POE 'Data User and ISP Systems' represents the systems users employ to access archived data. The general interface provided allows a broad range of users (e.g. planners, researchers, analysts, operators) and their systems (e.g. databases, models, analytical tools, user interface devices) to acquire data and analyses results from the archive. This physical object does not have any functionality defined in ARC-IT, as it exists outside the system functional boundary	Existing	Archived Data User System

This physical object does not have any functionality defined in ARC-IT, as it exists outside the system functional boundary	Existing	Other Transportation Information Centers
US Customs and Border Protection (CBP)	POE Roadway Inspection Systems	(POE) Port of entry Inspection systems and equipment represents data systems used at the border for the inspection of people or goods. It supports immigration, customs (trade), agricultural, and FDA inspections as applicable. It includes sensors and surveillance systems to identify and classify drivers and their cargo as they approach a border crossing, the systems used to interface with the back-office administration systems and provide information on status of the crossing or events. This element includes systems that support programs such as FAST, ACE, and Nexus. The Automated Commercial Environment (ACE) which is the commercial trade processing system for US Customs and Border Protection, supporting import/export cargo processing and enforcement operations at the border. Equipment might include electronic tag readers, identity card readers, or computer systems holding data on vehicles or travelers.	Existing	Border Inspection System

Equipment might include electronic tag readers, identity card readers, or computer systems holding data on vehicles or travelers.	Existing	Transportation Information Center
US Customs and Border Protection (CBP)	US Border Patrol Dispatch	This element represents the emergency dispatch of border patrol vehicles at the US and Arizona borders. Basically, this is the law enforcement dispatching center.	Existing	Emergency Management Center
US Customs and Border Protection (CBP)	US Border Patrol Dispatch	This element represents the emergency dispatch of border patrol vehicles at the US and Arizona borders. Basically, this is the law enforcement dispatching center.	Existing	Enforcement Center
US Customs and Border Protection (CBP)	US Border Patrol Vehicles	US Border Patrol law enforcement vehicles.	Existing	Emergency Vehicle OBE
US Immigration and Customs Enforcement (ICE)	US VISIT System	US-VISIT is a U.S. Department of Homeland Security program to verify the identity of incoming visitors and confirm compliance with visa and immigration policies. Allows CBP officers to match the incoming visitor's biometric identity with the biometric information stored on their Visa. This element represents the database systems that hold, and can share, the traveler information.	Existing	Border Inspection System

Appendix C – Service Packages Contained in the RAD-IT Database

Service Package Name	Service Package Description	Service Package Status	Included Elements
ADEM SEOC Wide Area Alert	This service package uses ITS driver and traveler information systems to alert the public in emergency situations such as child abductions, severe weather events, civil emergencies, and other situations that pose a threat to life and property. The alert includes information and instructions for transportation system operators and the traveling public, improving public safety and enlisting the public's help in some scenarios. The ITS technologies will supplement and support other emergency and homeland security alert systems such as the Emergency Alert System (EAS) or the IPAWS system. When an emergency situation is reported and verified and the terms and conditions for system activation are satisfied, a designated agency broadcasts emergency information to traffic agencies, transit agencies, information service providers, toll operators, and others that operate ITS systems. The ITS systems, in turn, provide the alert information to transportation system operators and the traveling public using ITS technologies such as dynamic message signs, highway advisory radios, in-vehicle displays, transit displays, 511 traveler information systems, and traveler information web sites.	Existing	ADOT 511 IVR
ADEM SEOC Wide Area Alert	This service package uses ITS driver and traveler information systems to alert the public in emergency situations such as child abductions, severe weather events, civil emergencies, and other situations that pose a threat to life and property. The alert includes information and instructions for transportation system operators and the traveling public, improving public safety and enlisting the public's help in some scenarios. The ITS technologies will supplement and support other emergency and homeland security alert systems such as the Emergency Alert System (EAS) or the IPAWS system. When an emergency situation is reported and verified and the terms and conditions for system activation are satisfied, a designated agency broadcasts emergency information to traffic agencies, transit agencies, information service providers, toll operators, and others that operate ITS systems. The ITS systems, in turn, provide the alert information to transportation system operators and the traveling public using ITS technologies such as dynamic message signs, highway advisory radios, in-vehicle displays, transit displays, 511 traveler information systems, and traveler information web sites.	Existing	ADOT 511 Website
ADEM SEOC Wide Area Alert	This service package uses ITS driver and traveler information systems to alert the public in emergency situations such as child abductions, severe weather events, civil emergencies, and other situations that pose a threat to life and property. The alert includes information and instructions for transportation system operators and the traveling public, improving public safety and enlisting the public's help in some scenarios. The ITS technologies will supplement and support other emergency and homeland security alert systems such as the Emergency Alert System (EAS) or the IPAWS system. Existing	DEMA Enforcement

Service Package Name	Service Package Description	Service Package Status	Included Elements
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	DEMA SEOC Arizona DEM Military Affairs
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	DEMA WebEOC System
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	DPS Central Communications Center
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	DPS Console Interface (Other LE)
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	Maricopa County EOC

Service Package Name	Service Package Description	Service Package Status	Included Elements
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	Mexico Customs and Border Patrol
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	Mexico Public Safety
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	Mexico Regional Maintenance Section
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	Mexico Regional TMC
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	Nevada State Police Dispatch

Service Package Name	Service Package Description	Service Package Status	Included Elements
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	New Mexico State Police Dispatch
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	NOAA _National Weather Service
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	Social Media and Networking
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	Tribal Public Safety Dispatch
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	Utah State Police Dispatch

Service Package Name	Service Package Description	Service Package Status	Included Elements
ADEM State Emergency Ops Center	This service package monitors and detects potential, looming, and actual disasters including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and acts of terrorism including nuclear, chemical, biological, and radiological weapons attacks). The service package monitors alerting and advisory systems, ITS sensors and surveillance systems, field reports, and emergency call-taking systems to identify emergencies and notifies all responding agencies of detected emergencies.	Existing	Wide Area Alerting Systems
ADOT ALERT Roadway Service Patrols	This service package supports roadway service patrol vehicles that monitor roads that aid motorists, offering rapid response to minor incidents (flat tire, accidents, out of gas) to minimize disruption to the traffic stream. If problems are detected, the roadway service patrol vehicles will provide assistance to the motorist (e.g., push a vehicle to the shoulder or median). The service package monitors service patrol vehicle locations and supports vehicle dispatch to identified incident locations. Incident information collected by the service patrol is shared with traffic, maintenance and construction, and traveler information systems.	Existing	ADOT DEOC-Dept EM Ops Center
ADOT ALERT Roadway Service Patrols	This service package supports roadway service patrol vehicles that monitor roads that aid motorists, offering rapid response to minor incidents (flat tire, accidents, out of gas) to minimize disruption to the traffic stream. If problems are detected, the roadway service patrol vehicles will provide assistance to the motorist (e.g., push a vehicle to the shoulder or median). The service package monitors service patrol vehicle locations and supports vehicle dispatch to identified incident locations. Incident information collected by the service patrol is shared with traffic, maintenance and construction, and traveler information systems.	Existing	ADOT HazMat Response Team
ADOT ALERT Roadway Service Patrols	This service package supports roadway service patrol vehicles that monitor roads that aid motorists, offering rapid response to minor incidents (flat tire, accidents, out of gas) to minimize disruption to the traffic stream. If problems are detected, the roadway service patrol vehicles will provide assistance to the motorist (e.g., push a vehicle to the shoulder or median). The service package monitors service patrol vehicle locations and supports vehicle dispatch to identified incident locations. Incident information collected by the service patrol is shared with traffic, maintenance and construction, and traveler information systems.	Existing	ADOT TOC and EMC
ADOT and CVO Dynamic Parking	This service package provides commercial vehicle related information such as truck parking locations and current status. The information will be based on data collected from the commercial fleet as well as general traffic data collection capabilities. The information can be provided directly to fleet managers, to mobile devices used by commercial vehicle operators, or directly to in vehicle systems as commercial vehicles approach roadway exits with key facilities such as parking. The service package can also provide oversize/ overweight permit information to commercial managers although there are no plans to provide this at the current time.	Planned	ADOT TOC and EMC

ADOT and CVO Dynamic Parking	This service package provides commercial vehicle related information such as truck parking locations and current status. The information will be based on data collected from the commercial fleet as well as general traffic data collection capabilities. The information can be provided directly to fleet managers, to mobile devices used by commercial vehicle operators, or directly to in vehicle systems as commercial vehicles approach roadway exits with key facilities such as parking. The service package can also provide oversize/ overweight permit information to commercial managers although there are no plans to provide this at the current time.	Planned	International Fuel Tax Agreement (IFTA) Clearinghouse
ADOT and CVO Dynamic Parking	This service package provides commercial vehicle related information such as truck parking locations and current status. The information will be based on data collected from the commercial fleet as well as general traffic data collection capabilities. The information can be provided directly to fleet managers, to mobile devices used by commercial vehicle operators, or directly to in vehicle systems as commercial vehicles approach roadway exits with key facilities such as parking. The service package can also provide oversize/ overweight permit information to commercial managers although there are no plans to provide this at the current time.	Planned	Personal Information Devices for Travelers
ADOT and NDOT DMS Coordinated TM	This service package provides for the sharing of information and control among traffic management centers to support regional traffic management strategies. Regional traffic management strategies that are supported include inter-jurisdictional, real-time coordinated traffic signal control systems and coordination between freeway operations and traffic signal control within a corridor. This service package advances the TM03-Traffic Signal Control and TM05-Traffic Metering service packages by adding the communications links and integrated control strategies that enable integrated, interjurisdictional traffic management. The nature of optimization and extent of information and control sharing is determined through working arrangements between jurisdictions. This package relies principally on roadside instrumentation supported by the Traffic Signal Control and Traffic Metering service packages and adds hardware, software, and fixed-point communications capabilities to implement traffic management strategies that are coordinated between allied traffic management centers. Several levels of coordination are supported from sharing of information through sharing of device control between traffic management centers.	Existing	ADOT DEOC-Dept EM Ops Center

Service Package Name	Service Package Description	Service Package Status	Included Elements
ADOT and NDOT Dynamic Roadway Warning	This service package includes systems that dynamically warn drivers approaching hazards on a roadway. Such hazards include roadway weather conditions, road surface conditions, traffic conditions including queues, obstacles or animals in the roadway and any other transient event that can be sensed. These dynamic roadway warning systems can alert approaching drivers via warning signs, flashing lights, in-vehicle messages, etc. Such systems can increase the safety of a roadway by reducing the occurrence of incidents. The system can be centrally monitored and controlled by a traffic management center or it can be autonomous. Speed warnings that consider the limitations of a given vehicle for the geometry of the roadway (e.g., rollover risk for tall vehicles) are not included in this service package but are covered by the TM17 – Speed Warning and Enforcement service package. Roadway warning systems, especially queue warning systems are an Active Traffic Management (ATM) strategy and are typically used in conjunction with other ATM strategies (such as TM20-Variable Speed Limits and TM22-Dynamic Lane Management and Shoulder Use).	Existing	ADOT DUST Detection System
ADOT and NDOT Dynamic Roadway Warning	This service package includes systems that dynamically warn drivers approaching hazards on a roadway. Such hazards include roadway weather conditions, road surface conditions, traffic conditions including queues, obstacles or animals in the roadway and any other transient event that can be sensed. Existing	AZTech Regional Info System (ARIS)
ADOT Crash Reporting Information System (CRIS) Data Archive	ADOT CRIS Data Archive service package provides access to crash data throughout the state. Configurations range from focused repositories that house data collected and owned by a single agency, district, private sector provider, or research institution to broad repositories that contain multimodal, multidimensional data from varied data sources covering a broader region. Both central repositories and physical distributed ITS data repositories are supported. Requests for data that are satisfied by access to a single repository in the ITS Data Warehouse service package may be parsed by the local repository and dynamically translated to requests to other repositories that relay the data necessary to satisfy the request.	Existing	ADOT AZ Crash Information System (ACIS)

ADOT DUST Weather Data Collection	This service package collects current road and weather conditions using data collected from environmental sensors deployed on and about the roadway. It also collects data from vehicles in the road network that can be used to directly measure or infer current environmental conditions. It leverages vehicle on-board systems that measure temperature, sense current weather conditions (rain and sun sensors) and also can monitor aspects of the vehicle operational status (e.g., use of headlights, wipers, and traction control system) to gather information about local environmental conditions. In addition, environmental sensor systems located on Maintenance and Construction Vehicles are also potential data sources. The collected environmental data is used by the Weather Information Processing and Distribution service package to process the information and make decisions on operations. The collected environmental data may be aggregated, combined with data attributes and sent to meteorological systems for data qualification and further data consolidation. The service package may also request and receive qualified data sets from meteorological systems.	Existing	ADOT Dust Detection Software System

Service Package Name	Service Package Description	Service Package Status	Included Elements
ADOT Emergency Response	This service package manages both unexpected incidents and planned events so that the impact to the transportation network and traveler safety is minimized. The service package includes incident detection capabilities through roadside surveillance devices (e.g. CCTV) and through regional coordination with other traffic management, maintenance and construction management and emergency management centers as well as rail operations and event promoters. Information from these diverse sources is collected and correlated by this service package to detect and verify incidents and implement an appropriate response. This service package supports traffic operations personnel in developing an appropriate response in coordination with emergency management, maintenance and construction management, and other incident response personnel to confirmed incidents. The response may include traffic control strategy modifications or resource coordination between center subsystems. Incident response also includes presentation of information to affected travelers using the Traffic Information Dissemination service package and dissemination of incident information to travelers through the Broadcast Traveler Information or Interactive Traveler Information service packages. The roadside equipment used to detect and verify incidents also allows the operator to monitor incident status as the response unfolds. The coordination with emergency management might be through a CAD system or through other communication with emergency field personnel. The coordination can also extend to tow trucks and other allied response agencies and field service personnel.	Existing	ADOT ECD Dispatch

ADOT Fleet and Freight Security	This service package provides enhanced security for commercial vehicle fleets and freight. Internal and external alerts and advisories are monitored to identify potential threats to the safety and security of the fleet and freight. It provides for the planning and tracking of three aspects of commercial vehicle shipments. For each shipment, the commercial vehicle, the freight equipment, and the commercial vehicle driver are monitored for consistency with the planned assignment. Any unauthorized changes are determined by the Fleet and Freight Management Center and then the appropriate people and Centers are notified. As the freight is shipped and tracked, security and public safety agencies may also interrogate the freight container to determine if it has been breached and to identify container contents. Once a route has been assigned, changes must be coordinated. Commercial Vehicle Drivers are alerted to any changes in route from the planned route and given an opportunity to justify a rerouting. Any unauthorized or unexpected route changes by the Commercial Vehicle will register a route deviation alert with the Fleet and Freight Management Center, which can notify local public safety agencies of the route deviation when appropriate (e.g., if there is safety sensitive HAZMAT being carried). Freight managers may decide to take further action on the alerts and/or provide responses that explain that the alerts are false alarms. If no explanation is received, the Fleet and Freight Management Center may notify the Emergency Management Center.	Planned	ADOT ECD CVO Administration Center

Existing	Archive Data Users
ADOT Incident Response Unit (IRU)	--Instance of PS08-- This service package supports roadway service patrol vehicles that monitor roads and aid motorists, offering rapid response to minor incidents (flat tire, accidents, out of gas) to minimize disruption to the traffic stream. If problems are detected, the roadway service patrol vehicles will provide assistance to the motorist (e.g., push a vehicle to the shoulder or median). The service package monitors service patrol vehicle locations and supports vehicle dispatch to identified incident locations. Incident information collected by the service patrol is shared with traffic, maintenance and construction, and traveler information systems.	Existing	ADOT Incident Response Unit (IRU)

ADOT Infrastructure-Based Traffic Surveillance	This service package includes traffic detectors, other surveillance equipment, the supporting field equipment, and fixed-point to fixed-point communications to transmit the collected data back to the Traffic Management Subsystem. The derived data can be used locally such as when traffic detectors are connected directly to a signal control system or remotely (e.g., when a CCTV system sends data back to the Traffic Management Subsystem). The data generated by this service package enables traffic managers to monitor traffic and road conditions, identify and verify incidents, detect faults in indicator operations, and collect census data for traffic strategy development and long range planning. The collected data can also be analyzed and made available to users and the Information Service Provider Subsystem.	Existing	ADOT 511 Website

ADOT Performance Monitoring	The Performance Monitoring service package uses information collected from various sources to support performance monitoring and other uses of historical data including transportation planning, condition monitoring, safety analyses, and research. The information may be probe data information obtained from vehicles in the network to determine network performance measures such as speed and travel times, or it may be information collected from the vehicles and processed by the infrastructure, e.g. environmental data and infrastructure conditions monitoring data.	Existing	ADOT HPMS Data User System
ADOT Performance Monitoring	The Performance Monitoring service package uses information collected from various sources to support performance monitoring and other uses of historical data including transportation planning, condition monitoring, safety analyses, and research. The information may be probe data information obtained from vehicles in the network to determine network performance measures such as speed and travel times, or it may be information collected from the vehicles and processed by the infrastructure, e.g. environmental data and infrastructure conditions monitoring data.	Existing	ADOT TOC Data Archive

ADOT Rail Grade Crossing	This service package manages highway traffic at highway-rail intersections (HRIs) where operational requirements do not dictate more advanced features (e.g., where rail operational speeds are less than 80 miles per hour). Both passive (e.g., the crossbuck sign) and active warning systems (e.g., flashing lights and gates) are supported. (Note that passive systems exercise only the single interface between the roadway subsystem and the driver in the architecture definition.) These traditional HRI warning systems may also be augmented with other standard traffic management devices. The warning systems are activated on notification by interfaced wayside equipment of an approaching train. The equipment at the HRI may also be interconnected with adjacent signalized intersections so that local control can be adapted to highway-rail intersection activities. Health monitoring of the HRI equipment and interfaces is performed; detected abnormalities are reported to both highway and railroad officials through wayside interfaces and interfaces to the traffic management subsystem.	Existing	ADOT ITS Field Equipment

ADOT Regional Maintenance Ops	This service package supports numerous services for scheduled and unscheduled maintenance and construction on a roadway system or right-of-way. Maintenance services include landscape maintenance, hazard removal (roadway debris, dead animals), routine maintenance activities (roadway cleaning, grass cutting), and repair and maintenance of both ITS and non-ITS equipment on the roadway (e.g., signs, traffic controllers, traffic detectors, dynamic message signs, traffic signals, CCTV, etc.). Environmental conditions information is also received from various weather sources to aid in scheduling maintenance and construction activities.	Existing	ADOT Asset Management Systems

ADOT Road Weather Information for Freight Carriers	The service package is a special case of the Road Weather Advisories and Warnings for Motorists service package that focuses on Freight Carrier users. It provides the capability to collect road weather data from connected vehicles and using that data to develop short term warnings or advisories that can be provided to individual commercial vehicles or to commercial vehicle dispatchers. The information may come from either vehicles operated by the general public and commercial entities (including passenger cars and trucks) or specialty vehicles and public fleet vehicles (such as snowplows, maintenance trucks, and other agency pool vehicles). The raw data will be processed in a controlling center to generate road segment-based data outputs. The processing will also include a road weather commercial vehicle alerts algorithm to generate short time horizon alerts that will be pushed to user systems and available to commercial vehicle dispatchers. In addition the information collected can be combined with observations and forecasts from other sources to provide medium (next 2-12 hours) or long term (more than 12 hours) advisories through a variety of interfaces including web based and connected vehicle based interfaces.	Planned	ADOT CV Roadside Equipment

ADOT RWIS Weather Data Collection	This service package collects current road and weather conditions using data collected from environmental sensors deployed on and about the roadway (or guideway in the case of transit related rail systems). In addition to fixed sensor stations at the roadside, sensing of the roadway environment can also occur from sensor systems located on Maintenance and Construction Vehicles. The collected environmental data is used by the Weather Information Processing and Distribution service package to process the information and make decisions on operations. The collected environmental data may be aggregated, combined with data attributes and sent to meteorological systems for data qualification and further data consolidation. The service package may also request and receive qualified data sets from meteorological systems.	Existing	ADOT Roadside Comm Equipment

ADOT Speed Harmonization	This service package determines speed recommendations based on traffic conditions and weather information and uses connected vehicle technologies to assist in harmonizing speeds to these recommendations. The speed recommendations can be regulatory (e.g. variable speed limits) or advisory. The purpose of speed harmonization is to change traffic speed on links that approach areas of traffic congestion, bottlenecks, incidents, special events, and other conditions that affect flow. Speed harmonization assists in maintaining flow, reducing unnecessary stops and starts, and maintaining consistent speeds. The service package utilizes connected vehicle V2I communication to detect the precipitating roadway or congestion conditions that might necessitate speed harmonization, to generate the appropriate response plans and speed recommendation strategies for upstream traffic, and to broadcast such recommendations to the affected vehicles. The speed recommendations can be provided in-vehicle for connected vehicles, or through roadside signage for non-connected vehicles.	Planned	ADOT CV Roadside Equipment

ADOT Speed Harmonization	This service package determines speed recommendations based on traffic conditions and weather information and uses connected vehicle technologies to assist in harmonizing speeds to these recommendations. The speed recommendations can be regulatory (e.g. variable speed limits) or advisory. The purpose of speed harmonization is to change traffic speed on links that approach areas of traffic congestion, bottlenecks, incidents, special events, and other conditions that affect flow. Speed harmonization assists in maintaining flow, reducing unnecessary stops and starts, and maintaining consistent speeds. The service package utilizes connected vehicle V2I communication to detect the precipitating roadway or congestion conditions that might necessitate speed harmonization, to generate the appropriate response plans and speed recommendation strategies for upstream traffic, and to broadcast such recommendations to the affected vehicles. The speed recommendations can be provided in-vehicle for connected vehicles, or through roadside signage for non-connected vehicles.	Planned	ADOT RWIS

The speed recommendations can be provided in-vehicle for connected vehicles, or through roadside signage for non-connected vehicles.	Planned	ADOT TOC and EMC
ADOT Speed Warning	This service package monitors vehicle speeds and supports warning drivers when their speed is excessive. Speed monitoring can be made via spot speed or average speed measurements. Roadside equipment can display the speed of passing vehicles and/or suggest a safe driving speed. Environmental conditions and vehicle characteristics may be monitored and factored into the safe speed advisories that are provided to the motorist. For example, warnings can be generated recognizing the limitations of a given vehicle for the geometry of the roadway such as rollover risk for tall vehicles. This service focuses on monitoring of vehicle speeds while the variable speed limits service (covered in TM20-Variable Speed Limits service package) focuses on varying the posted speed limits to create more uniform speeds along a roadway, to promote safer driving during adverse conditions (such as fog) and/or to reduce air pollution.	Planned	ADOT CV Roadside Equipment

Planned	ADOT TOC and EMC
ADOT Statewide TOC Traffic Management Center	This service package provides for the sharing of traffic information and control among traffic management centers to support regional traffic management strategies. Regional traffic management strategies that are supported include inter-jurisdictional, real-time coordinated traffic signal control systems and coordination between freeway operations and traffic signal control within a corridor. This service package advances the ATMS03-Traffic Signal Control and ATMS04-Traffic Metering service packages by adding the communications links and integrated control strategies that enable integrated, interjurisdictional traffic management. The nature of optimization and extent of information and control sharing is determined through working arrangements between jurisdictions. This package relies principally on roadside instrumentation supported by the Traffic Signal Control and Traffic Metering service packages and adds hardware, software, and fixed-point to fixed-point communications capabilities to implement traffic management strategies that are coordinated between allied traffic management centers. Several levels of coordination are supported from sharing of information through sharing of control between traffic management centers.	Existing	ADOT TOC and EMC

ADOT Traffic Incident Management System	This service package manages both unexpected incidents and planned events so that the impact to the transportation network and traveler safety is minimized. The service package includes incident detection capabilities through roadside surveillance devices (e.g. CCTV) and through regional coordination with other traffic management, maintenance and construction management and emergency management centers as well as rail operations and event promoters. Information from these diverse sources is collected and correlated by this service package to detect and verify incidents and implement an appropriate response. This service package supports traffic operations personnel in developing an appropriate response in coordination with emergency management, maintenance and construction management, and other incident response personnel to confirmed incidents. The response may include traffic control strategy modifications or resource coordination between center subsystems. Incident response also includes presentation of information to affected travelers using the Traffic Information Dissemination service package and dissemination of incident information to travelers through the Broadcast Traveler Information or Interactive Traveler Information service packages. The roadside equipment used to detect and verify incidents also allows the operator to monitor incident status as the response unfolds. The coordination with emergency management might be through a CAD system or through other communication with emergency field personnel. The coordination can also extend to tow trucks and other allied response agencies and field service personnel.	Existing	ADOT 511 Website

Service Package Name	Service Package Description	Service Package Status	Included Elements
ADOT Traffic Information Dissemination	This service package provides driver information using roadway equipment such as dynamic message signs or highway advisory radio. A wide range of information can be disseminated including traffic and road conditions, closure and detour information, travel restrictions, incident information, and emergency alerts and driver advisories. This package provides information to drivers at specific equipped locations on the road network. Careful placement of the roadway equipment provides the information at points in the network where the drivers have recourse and can tailor their routes to account for the new information. This package also covers the equipment and interfaces that provide traffic information from a traffic management center to the media (for instance via a direct tie-in between a traffic management center and radio or television station computer systems), Transit Management, Emergency Management, and Information Service Providers. A link to the Maintenance and Construction Management subsystem allows real time information on road/bridge closures and restrictions due to maintenance and construction activities to be disseminated. The sharing of transportation operations data described in this service package also supports other services like TM 09- Traffic Decision Support and Demand Management.	Existing	ADOT 511 IVR

This package provides information to drivers at specific equipped locations on the road network. Careful placement of the roadway equipment provides the information at points in the network where the drivers have recourse and can tailor their routes to account for the new information. This package also covers the equipment and interfaces that provide traffic information from a traffic management center to the media (for instance via a direct tie-in between a traffic management center and radio or television station computer systems), Transit Management, Emergency Management, and Information Service Providers. A link to the Maintenance and Construction Management subsystem allows real time information on road/bridge closures and restrictions due to maintenance and construction activities to be disseminated. The sharing of transportation operations data described in this service package also supports other services like TM 09- Traffic Decision Support and Demand Management.	Existing	ADOT RWIS

Service Package Name	Service Package Description	Service Package Status	Included Elements
ADOT Traffic Information Dissemination	This service package provides driver information using roadway equipment such as dynamic message signs or highway advisory radio. A wide range of information can be disseminated including traffic and road conditions, closure and detour information, travel restrictions, incident information, and emergency alerts and driver advisories. This package provides information to drivers at specific equipped locations on the road network. Careful placement of the roadway equipment provides the information at points in the network where the drivers have recourse and can tailor their routes to account for the new information. This package also covers the equipment and interfaces that provide traffic information from a traffic management center to the media (for instance via a direct tie-in between a traffic management center and radio or television station computer systems), Transit Management, Emergency Management, and Information Service Providers. A link to the Maintenance and Construction Management subsystem allows real time information on road/bridge closures and restrictions due to maintenance and construction activities to be disseminated. The sharing of transportation operations data described in this service package also supports other services like TM 09- Traffic Decision Support and Demand Management.	Existing	ADOT TOC and EMC

The sharing of transportation operations data described in this service package also supports other services like TM 09- Traffic Decision Support and Demand Management.	Existing	Public Private Traveler Information
ADOT Traffic Metering	This service package provides central monitoring and control, communications, and field equipment that support metering of traffic. It supports the complete range of metering strategies including ramp, interchange, and mainline metering. This package incorporates the instrumentation included in the Network Surveillance service package (traffic sensors are used to measure traffic flow and queues) to support traffic monitoring so responsive and adaptive metering strategies can be implemented. Also included is configurable field equipment to provide information to drivers approaching a meter, such as advance warning of the meter, its operational status (whether it is currently on or not, how many cars per green are allowed, etc.), lane usage at the meter (including a bypass lane for HOVs) and existing queue at the meter.	Existing	ADOT Mainline Detection

Existing	ADOT TOC and EMC
ADOT Traffic Signal Control	This service package provides the central control and monitoring equipment, communication links, and the signal control equipment that support traffic control at signalized intersections. A range of traffic signal control systems are represented by this service package ranging from fixed-schedule control systems to fully traffic responsive systems that dynamically adjust control plans and strategies based on current traffic conditions and priority requests. This service package is generally an intra-jurisdictional package. Systems that achieve coordination across jurisdictions by using a common time base or other strategies that do not require real time coordination would also be represented by this package. Coordination of traffic signal systems using real-time communications is covered in the TM07-Regional Traffic Management service package. This service package is consistent with typical traffic signal control systems.	Existing	ADOT DUST Detection System
ADOT Traffic Signal Control	This service package provides the central control and monitoring equipment, communication links, and the signal control equipment that support traffic control at signalized intersections. Service Package Name	Service Package Description	Service Package Status	Included Elements
ADOT Variable Speed	This service package sets variable speed limits along a roadway to create more uniform speeds, to promote safer driving during adverse conditions (such as fog), and/or to reduce air pollution. Also known as speed harmonization, this service monitors traffic and environmental conditions along the roadway. Based on the measured data, the system calculates and sets suitable speed limits, usually by lane. Equipment over and along the roadway displays the speed limits and additional information such as basic safety rules and current traffic information. The system can be centrally monitored and controlled by a traffic management center or it can be autonomous. This service establishes variable speed limits and communicates the speed limits to drivers. Speed warnings and enforcement of speeds limits, including variable speed limits, is covered in the ATMS19-Automated Speed Warning and Enforcement service package.Variable speed limits are an Active Traffic Management (ATM) strategy and are typically used in conjunction with other ATM strategies (such as ATMS23-Dynamic Lane Management and Shoulder Use and ATMS24-Dynamic Roadway Warning).	Planned	ADOT Dust Detection Software System
ADOT Variable Speed	This service package sets variable speed limits along a roadway to create more uniform speeds, to promote safer driving during adverse conditions (such as fog), and/or to reduce air pollution. Amber Alert	This service package uses ITS driver and traveler information systems to alert the public in emergency situations such as child abductions, severe weather events, civil emergencies, and other situations that pose a threat to life and property. The alert includes information and instructions for transportation system operators and the traveling public, improving public safety and enlisting the public's help in some scenarios. The ITS technologies will supplement and support other emergency and homeland security alert systems such as the Emergency Alert System (EAS). When an emergency situation is reported and verified and the terms and conditions for system activation are satisfied, a designated agency broadcasts emergency information to traffic agencies, transit agencies, information service providers, toll operators, and others that operate ITS systems. The ITS systems, in turn, provide the alert information to transportation system operators and the traveling public using ITS technologies such as dynamic message signs, highway advisory radios, in-vehicle displays, transit displays, 511 traveler information systems, and traveler information web sites.	Existing	ADOT 511 Website

Service Package Name	Service Package Description	Service Package Status	Included Elements
Amber Alert	This service package uses ITS driver and traveler information systems to alert the public in emergency situations such as child abductions, severe weather events, civil emergencies, and other situations that pose a threat to life and property. The alert includes information and instructions for transportation system operators and the traveling public, improving public safety and enlisting the public's help in some scenarios. The ITS technologies will supplement and support other emergency and homeland security alert systems such as the Emergency Alert System (EAS). When an emergency situation is reported and verified and the terms and conditions for system activation are satisfied, a designated agency broadcasts emergency information to traffic agencies, transit agencies, information service providers, toll operators, and others that operate ITS systems. The ITS systems, in turn, provide the alert information to transportation system operators and the traveling public using ITS technologies such as dynamic message signs, highway advisory radios, in-vehicle displays, transit displays, 511 traveler information systems, and traveler information web sites.	Existing	DPS Console Interface (Other LE)

Existing	Wide Area Alerting Systems
Arizona 511 IVR	This service package provides tailored information in response to a traveler request. Both real-time interactive request/response systems and information systems that "push" a tailored stream of information to the traveler based on a submitted profile are supported. The traveler can obtain current information regarding traffic conditions, roadway maintenance and construction, transit services, ride share/ride match, parking management, detours and pricing information. Although the Internet is the predominate network used for traveler information dissemination, a range of two-way wide-area wireless and fixed-point to fixed-point communications systems may be used to support the required data communications between the traveler and Information Service Provider. A variety of interactive devices may be used by the traveler to access information prior to a trip or en route including phone via a 511-like portal and web pages via kiosk, personal digital assistant, personal computer, and a variety of in-vehicle devices. This service package also allows value-added resellers to collect transportation information that can be aggregated and be available to their personal devices or remote traveler systems to better inform their customers of transportation conditions. Successful deployment of this service package relies on availability of real-time transportation data from roadway instrumentation, transit, probe vehicles or other means. A traveler may also input personal preferences and identification information via a "traveler card" that can convey information to the system about the traveler as well as receive updates from the system so the card can be updated over time.	Existing	ADOT 511 IVR

Arizona Autonomous Vehicle Safety Systems	This service package improves vehicle safety using on-board sensors that monitor the driving environment surrounding the vehicle. All levels of driving automation are supported ranging from basic warning systems that warn the driver through full automation where the vehicle controls the steering and acceleration/decelaration in all scenarios and environments, without driver intervention. Unlike other Vehicle Safety service packages, this service package includes autonomous capabilities that rely only on on-board systems without communication with other vehicles or the infrastructure.	Planned	Basic Private Vehicle
Arizona Carrier Operations and Fleet Management	This service package manages a fleet of commercial vehicles. The Fleet and Freight Management Center monitors the vehicle fleet and can provide routes using either an in-house capability or an external provider. Routes generated by either approach are constrained by hazardous materials and other restrictions (such as height or weight). A route would be electronically sent to the Commercial Vehicle with any appropriate dispatch instructions. The location of the Commercial Vehicle can be monitored by the Fleet and Freight Management Center and routing changes can be made depending on current road network conditions.	Planned	ADOT MVD Commercial Vehicle Administration

Service Package Name	Service Package Description	Service Package Status	Included Elements
Arizona Connected Vehicle Situational Awareness	This service package shares information about potentially hazardous road conditions or road hazards with other vehicles to support enhanced driver warnings and control automation. Vehicles broadcast relevant road condition information that is collected by the vehicle, such as fog or icy roads. This service package supports the capability for connected vehicles to share situational awareness information even in areas where no roadside communications infrastructure exists. It can be useful to vehicles that are not fully equipped with sensors, or vehicles entering an area with hazardous conditions. Roadside communications infrastructure, if available, can extend the situational awareness range to cover wrong way vehicles where closing rates can require notification beyond DSRC communications range.	Planned	ADOT CV Roadside Equipment

Arizona Connected Vehicles Em Response	The Vehicle Emergency Response service package was developed as a pilot project in Arizona. It provides arriving public safety vehicles with information from connected vehicles involved in a crash. Emergency responders need information about the vehicles involved in a crash to respond safely and effectively to the vehicle crash. Information such as HAZMAT data can assist the responders. Information about air bag activations and other measures indicating the severity of the crash can provide useful input to ambulance staff. In addition information about the power system of the vehicle (e.g. hybrid, electric, or internal combustion engine) can affect the response.	Existing	Commercial Vehicles

Arizona Dial-a-Ride Services	This service package performs automated dispatch and system monitoring for demand responsive transit services. This service performs scheduling activities as well as operator assignment. In addition, this service package performs similar functions to support dynamic features of flexible-route transit services. This package monitors the current status of the transit fleet and supports allocation of these fleet resources to service incoming requests for transit service while also considering traffic conditions. The Transit Management Subsystem provides the necessary data processing and information display to assist the transit operator in making optimal use of the transit fleet. This service includes the capability for a traveler request for personalized transit services to be made through the Information Service Provider (ISP) Subsystem. The ISP may either be operated by a transit management center or be independently owned and operated by a separate service provider. In the first scenario, the traveler makes a direct request to a specific paratransit service. In the second scenario, a third party service provider determines that the paratransit service is a viable means of satisfying a traveler request and makes a reservation for the traveler.	Existing	Local Dial-A-Ride Transit Dispatchers

This package monitors the current status of the transit fleet and supports allocation of these fleet resources to service incoming requests for transit service while also considering traffic conditions. The Transit Management Subsystem provides the necessary data processing and information display to assist the transit operator in making optimal use of the transit fleet. This service includes the capability for a traveler request for personalized transit services to be made through the Information Service Provider (ISP) Subsystem. The ISP may either be operated by a transit management center or be independently owned and operated by a separate service provider. In the first scenario, the traveler makes a direct request to a specific paratransit service. In the second scenario, a third party service provider determines that the paratransit service is a viable means of satisfying a traveler request and makes a reservation for the traveler.	Existing	Public Private Traveler Information

Service Package Name	Service Package Description	Service Package Status	Included Elements
Arizona Dial-a-Ride Services	This service package performs automated dispatch and system monitoring for demand responsive transit services. This service performs scheduling activities as well as operator assignment. In addition, this service package performs similar functions to support dynamic features of flexible-route transit services. This package monitors the current status of the transit fleet and supports allocation of these fleet resources to service incoming requests for transit service while also considering traffic conditions. The Transit Management Subsystem provides the necessary data processing and information display to assist the transit operator in making optimal use of the transit fleet. Service Package Name	Service Package Description	Service Package Status	Included Elements
Arizona Disaster Response and Recovery	This service package enhances the ability of the surface transportation system to respond to and recover from disasters. It addresses the most severe incidents that require an extraordinary response from outside the local community. All types of disasters are addressed including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and national security emergencies such as nuclear, chemical, biological, and radiological weapons attacks).The service package supports coordination of emergency response plans, including general plans developed before a disaster as well as specific tactical plans with short time horizon that are developed as part of a disaster response. The service package provides enhanced access to the scene for response personnel and resources, provides better information about the transportation system in the vicinity of the disaster, and maintains situation awareness regarding the disaster itself. In addition, this service package tracks and coordinates the transportation resources - the transportation professionals, equipment, and materials - that constitute a portion of the disaster response.The service package identifies the key points of integration between transportation systems and the public safety, emergency management, public health, and other allied organizations that form the overall disaster response. In this service package, the Emergency Management subsystem represents the federal, regional, state, and local Emergency Operations Centers and the Incident Commands that are established to respond to the disaster. The interface between the Emergency Management Subsystem and the other center subsystems provides situation awareness and resource coordination among transportation and other allied response agencies. In its role, traffic management implements special traffic control strategies and detours and restrictions to effectively manage traffic in and around the disaster. Maintenance and construction provides damage assessment of road network facilities and manages service restoration. Transit management provides a similar assessment of status for transit facilities and modifies transit operations to meet the special demands of the disaster. As immediate public safety concerns are addressed and disaster response transitions into recovery, this service package supports transition back to normal transportation system operation, recovering resources, managing on-going transportation facility repair, supporting data collection and revised plan coordination, and other recovery activities. This service package builds on the basic traffic incident response service that is provided by ATMS08, the Traffic Incident Management service package. This service package addresses the additional complexities and coordination requirements that are associated with the most severe incidents that warrant an extraordinary response from outside the local jurisdictions and require special measures such as the activation of one or more emergency operations centers. Many users of the National ITS Architecture will want to consider both ATMS08 and this service package since every region is concerned with both day-to-day management of traffic-related incidents and occasional management of disasters that require extraordinary response.Disaster Response and Recovery is also supported by EM10, the "Disaster Traveler Information" service package that keeps the public informed during a disaster response. See that service package for more information.	Existing	ADOT 511 Website

It addresses the most severe incidents that require an extraordinary response from outside the local community. All types of disasters are addressed including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and national security emergencies such as nuclear, chemical, biological, and radiological weapons attacks).The service package supports coordination of emergency response plans, including general plans developed before a disaster as well as specific tactical plans with short time horizon that are developed as part of a disaster response. The service package provides enhanced access to the scene for response personnel and resources, provides better information about the transportation system in the vicinity of the disaster, and maintains situation awareness regarding the disaster itself. In addition, this service package tracks and coordinates the transportation resources - the transportation professionals, equipment, and materials - that constitute a portion of the disaster response.The service package identifies the key points of integration between transportation systems and the public safety, emergency management, public health, and other allied organizations that form the overall disaster response. In this service package, the Emergency Management subsystem represents the federal, regional, state, and local Emergency Operations Centers and the Incident Commands that are established to respond to the disaster. The interface between the Emergency Management Subsystem and the other center subsystems provides situation awareness and resource coordination among transportation and other allied response agencies. In its role, traffic management implements special traffic control strategies and detours and restrictions to effectively manage traffic in and around the disaster. Maintenance and construction provides damage assessment of road network facilities and manages service restoration. Transit management provides a similar assessment of status for transit facilities and modifies transit operations to meet the special demands of the disaster. As immediate public safety concerns are addressed and disaster response transitions into recovery, this service package supports transition back to normal transportation system operation, recovering resources, managing on-going transportation facility repair, supporting data collection and revised plan coordination, and other recovery activities. This service package builds on the basic traffic incident response service that is provided by ATMS08, the Traffic Incident Management service package. This service package addresses the additional complexities and coordination requirements that are associated with the most severe incidents that warrant an extraordinary response from outside the local jurisdictions and require special measures such as the activation of one or more emergency operations centers. Many users of the National ITS Architecture will want to consider both ATMS08 and this service package since every region is concerned with both day-to-day management of traffic-related incidents and occasional management of disasters that require extraordinary response.Disaster Response and Recovery is also supported by EM10, the "Disaster Traveler Information" service package that keeps the public informed during a disaster response. See that service package for more information.	Existing	CHP Dispatch

Service Package Name	Service Package Description	Service Package Status	Included Elements
Arizona Disaster Response and Recovery	This service package enhances the ability of the surface transportation system to respond to and recover from disasters. It addresses the most severe incidents that require an extraordinary response from outside the local community. All types of disasters are addressed including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and national security emergencies such as nuclear, chemical, biological, and radiological weapons attacks).The service package supports coordination of emergency response plans, including general plans developed before a disaster as well as specific tactical plans with short time horizon that are developed as part of a disaster response. The service package provides enhanced access to the scene for response personnel and resources, provides better information about the transportation system in the vicinity of the disaster, and maintains situation awareness regarding the disaster itself. In addition, this service package tracks and coordinates the transportation resources - the transportation professionals, equipment, and materials - that constitute a portion of the disaster response.The service package identifies the key points of integration between transportation systems and the public safety, emergency management, public health, and other allied organizations that form the overall disaster response. In this service package, the Emergency Management subsystem represents the federal, regional, state, and local Emergency Operations Centers and the Incident Commands that are established to respond to the disaster. The interface between the Emergency Management Subsystem and the other center subsystems provides situation awareness and resource coordination among transportation and other allied response agencies. In its role, traffic management implements special traffic control strategies and detours and restrictions to effectively manage traffic in and around the disaster. Maintenance and construction provides damage assessment of road network facilities and manages service restoration. Transit management provides a similar assessment of status for transit facilities and modifies transit operations to meet the special demands of the disaster. As immediate public safety concerns are addressed and disaster response transitions into recovery, this service package supports transition back to normal transportation system operation, recovering resources, managing on-going transportation facility repair, supporting data collection and revised plan coordination, and other recovery activities. This service package builds on the basic traffic incident response service that is provided by ATMS08, the Traffic Incident Management service package. This service package addresses the additional complexities and coordination requirements that are associated with the most severe incidents that warrant an extraordinary response from outside the local jurisdictions and require special measures such as the activation of one or more emergency operations centers. Many users of the National ITS Architecture will want to consider both ATMS08 and this service package since every region is concerned with both day-to-day management of traffic-related incidents and occasional management of disasters that require extraordinary response.Disaster Response and Recovery is also supported by EM10, the "Disaster Traveler Information" service package that keeps the public informed during a disaster response. See that service package for more information.	Existing	DEMA Enforcement

Many users of the National ITS Architecture will want to consider both ATMS08 and this service package since every region is concerned with both day-to-day management of traffic-related incidents and occasional management of disasters that require extraordinary response.Disaster Response and Recovery is also supported by EM10, the "Disaster Traveler Information" service package that keeps the public informed during a disaster response. See that service package for more information.	Existing	Mexico Regional Maintenance Section

Service Package Name	Service Package Description	Service Package Status	Included Elements
Arizona Disaster Response and Recovery	This service package enhances the ability of the surface transportation system to respond to and recover from disasters. It addresses the most severe incidents that require an extraordinary response from outside the local community. All types of disasters are addressed including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and national security emergencies such as nuclear, chemical, biological, and radiological weapons attacks).The service package supports coordination of emergency response plans, including general plans developed before a disaster as well as specific tactical plans with short time horizon that are developed as part of a disaster response. The service package provides enhanced access to the scene for response personnel and resources, provides better information about the transportation system in the vicinity of the disaster, and maintains situation awareness regarding the disaster itself. In addition, this service package tracks and coordinates the transportation resources - the transportation professionals, equipment, and materials - that constitute a portion of the disaster response.The service package identifies the key points of integration between transportation systems and the public safety, emergency management, public health, and other allied organizations that form the overall disaster response. In this service package, the Emergency Management subsystem represents the federal, regional, state, and local Emergency Operations Centers and the Incident Commands that are established to respond to the disaster. The interface between the Emergency Management Subsystem and the other center subsystems provides situation awareness and resource coordination among transportation and other allied response agencies. In its role, traffic management implements special traffic control strategies and detours and restrictions to effectively manage traffic in and around the disaster. Maintenance and construction provides damage assessment of road network facilities and manages service restoration. Transit management provides a similar assessment of status for transit facilities and modifies transit operations to meet the special demands of the disaster. As immediate public safety concerns are addressed and disaster response transitions into recovery, this service package supports transition back to normal transportation system operation, recovering resources, managing on-going transportation facility repair, supporting data collection and revised plan coordination, and other recovery activities. This service package builds on the basic traffic incident response service that is provided by ATMS08, the Traffic Incident Management service package. This service package addresses the additional complexities and coordination requirements that are associated with the most severe incidents that warrant an extraordinary response from outside the local jurisdictions and require special measures such as the activation of one or more emergency operations centers. Many users of the National ITS Architecture will want to consider both ATMS08 and this service package since every region is concerned with both day-to-day management of traffic-related incidents and occasional management of disasters that require extraordinary response.Disaster Response and Recovery is also supported by EM10, the "Disaster Traveler Information" service package that keeps the public informed during a disaster response. This service package builds on the basic traffic incident response service that is provided by ATMS08, the Traffic Incident Management service package. This service package addresses the additional complexities and coordination requirements that are associated with the most severe incidents that warrant an extraordinary response from outside the local jurisdictions and require special measures such as the activation of one or more emergency operations centers. Many users of the National ITS Architecture will want to consider both ATMS08 and this service package since every region is concerned with both day-to-day management of traffic-related incidents and occasional management of disasters that require extraordinary response.Disaster Response and Recovery is also supported by EM10, the "Disaster Traveler Information" service package that keeps the public informed during a disaster response. See that service package for more information.	Existing	US Border Patrol Dispatch

Service Package Name	Service Package Description	Service Package Status	Included Elements
Arizona Disaster Response and Recovery	This service package enhances the ability of the surface transportation system to respond to and recover from disasters. It addresses the most severe incidents that require an extraordinary response from outside the local community. All types of disasters are addressed including natural disasters (hurricanes, earthquakes, floods, winter storms, tsunamis, etc.) and technological and man-made disasters (hazardous materials incidents, nuclear power plant accidents, and national security emergencies such as nuclear, chemical, biological, and radiological weapons attacks).The service package supports coordination of emergency response plans, including general plans developed before a disaster as well as specific tactical plans with short time horizon that are developed as part of a disaster response. The service package provides enhanced access to the scene for response personnel and resources, provides better information about the transportation system in the vicinity of the disaster, and maintains situation awareness regarding the disaster itself. In addition, this service package tracks and coordinates the transportation resources - the transportation professionals, equipment, and materials - that constitute a portion of the disaster response.The service package identifies the key points of integration between transportation systems and the public safety, emergency management, public health, and other allied organizations that form the overall disaster response. In this service package, the Emergency Management subsystem represents the federal, regional, state, and local Emergency Operations Centers and the Incident Commands that are established to respond to the disaster. The interface between the Emergency Management Subsystem and the other center subsystems provides situation awareness and resource coordination among transportation and other allied response agencies. In its role, traffic management implements special traffic control strategies and detours and restrictions to effectively manage traffic in and around the disaster. Maintenance and construction provides damage assessment of road network facilities and manages service restoration. Transit management provides a similar assessment of status for transit facilities and modifies transit operations to meet the special demands of the disaster. As immediate public safety concerns are addressed and disaster response transitions into recovery, this service package supports transition back to normal transportation system operation, recovering resources, managing on-going transportation facility repair, supporting data collection and revised plan coordination, and other recovery activities. This service package builds on the basic traffic incident response service that is provided by ATMS08, the Traffic Incident Management service package. Arizona Disaster Traveler Information	This service package uses ITS to provide disaster-related traveler information to the general public, including evacuation and reentry information and other information concerning the operation of the transportation system during a disaster. This service package collects information from multiple sources including traffic, transit, public safety, emergency management, shelter provider, and travel service provider organizations. The collected information is processed and the public is provided with real-time disaster and evacuation information using ITS traveler information systems.A disaster will stress the surface transportation system since it may damage transportation facilities at the same time that it places unique demands on these facilities to support public evacuation and provide access for emergency responders. Similarly, a disaster may interrupt or degrade the operation of many traveler information systems at the same time that safety-critical information must be provided to the traveling public. This service package keeps the public informed in these scenarios, using all available means to provide information about the disaster area including damage to the transportation system, detours and closures in effect, special traffic restrictions and allowances, special transit schedules, and real-time information on traffic conditions and transit system performance in and around the disaster.This service package also provides emergency information to assist the public with evacuations when necessary. Information on mandatory and voluntary evacuation zones, evacuation times, and instructions are provided. Available evacuation routes and destinations and current and anticipated travel conditions along those routes are provided so evacuees are prepared and know their destination and preferred evacuation route. Information on available transit services and traveler services (shelters, medical services, hotels, restaurants, gas stations, etc.) is also provided. In addition to general evacuation information, this service package provides specific evacuation trip planning information that is tailored for the evacuee based on origin, selected destination, and evacuee-specified evacuation requirements and route parameters.This service package augments the ATIS service packages that provide traveler information on a day-to-day basis for the surface transportation system. This service package provides focus on the special requirements for traveler information dissemination in disaster situations.	Existing	ADOT 511 IVR

The collected information is processed and the public is provided with real-time disaster and evacuation information using ITS traveler information systems.A disaster will stress the surface transportation system since it may damage transportation facilities at the same time that it places unique demands on these facilities to support public evacuation and provide access for emergency responders. Similarly, a disaster may interrupt or degrade the operation of many traveler information systems at the same time that safety-critical information must be provided to the traveling public. This service package keeps the public informed in these scenarios, using all available means to provide information about the disaster area including damage to the transportation system, detours and closures in effect, special traffic restrictions and allowances, special transit schedules, and real-time information on traffic conditions and transit system performance in and around the disaster.This service package also provides emergency information to assist the public with evacuations when necessary. Information on mandatory and voluntary evacuation zones, evacuation times, and instructions are provided. Available evacuation routes and destinations and current and anticipated travel conditions along those routes are provided so evacuees are prepared and know their destination and preferred evacuation route. Information on available transit services and traveler services (shelters, medical services, hotels, restaurants, gas stations, etc.) is also provided. In addition to general evacuation information, this service package provides specific evacuation trip planning information that is tailored for the evacuee based on origin, selected destination, and evacuee-specified evacuation requirements and route parameters.This service package augments the ATIS service packages that provide traveler information on a day-to-day basis for the surface transportation system. This service package provides focus on the special requirements for traveler information dissemination in disaster situations.	Existing	DEMA WebEOC System

Arizona Dynamic Transit Operations	The Dynamic Transit Operations service package allows travelers to request trips and obtain itineraries using a personal device such as a smart phone, tablet, or personal computer. The trips and itineraries cover multiple transportation services (public transportation modes, private transportation services, shared-ride, walking and biking). This service package builds on existing technology systems such as computer-aided dispatch/ automated vehicle location (CAD/AVL) systems and automated scheduling software, providing a coordination function within and between transit providers that would dynamically schedule and dispatch or modify the route of an in-service vehicle by matching compatible trips together. TI06 covers other shared use transportation options.	Planned	Cities and Towns Transit Dispatch

The trips and itineraries cover multiple transportation services (public transportation modes, private transportation services, shared-ride, walking and biking). This service package builds on existing technology systems such as computer-aided dispatch/ automated vehicle location (CAD/AVL) systems and automated scheduling software, providing a coordination function within and between transit providers that would dynamically schedule and dispatch or modify the route of an in-service vehicle by matching compatible trips together. TI06 covers other shared use transportation options.	Planned	NAIPTA (dba Mountain Line) Transit Buses
Arizona Dynamic Transit Operations	The Dynamic Transit Operations service package allows travelers to request trips and obtain itineraries using a personal device such as a smart phone, tablet, or personal computer. The trips and itineraries cover multiple transportation services (public transportation modes, private transportation services, shared-ride, walking and biking). This service package builds on existing technology systems such as computer-aided dispatch/ automated vehicle location (CAD/AVL) systems and automated scheduling software, providing a coordination function within and between transit providers that would dynamically schedule and dispatch or modify the route of an in-service vehicle by matching compatible trips together. TI06 covers other shared use transportation options.	Planned	NAIPTA (dba Mountain Line) Transit Management Center
Arizona Dynamic Transit Operations	The Dynamic Transit Operations service package allows travelers to request trips and obtain itineraries using a personal device such as a smart phone, tablet, or personal computer. Arizona Electronic Clearance	This service package provides for high speed weigh-in-motion with or without Automated Vehicle Identification (AVI) capabilities. This service package provides the roadside equipment that could be used as a stand-alone system or to augment the Electronic Clearance (CVO03) service package.	Existing	Commercial Vehicles
Arizona Emergency Call-Taking and Dispatch	This service package provides basic public safety call-taking and dispatch services. It includes emergency vehicle equipment, equipment used to receive and route emergency calls, and wireless communications that enable safe and rapid deployment of appropriate resources to an emergency. Coordination between Emergency Management Centers supports emergency notification between agencies. Wide area wireless communications between the Emergency Management Center and an Emergency Vehicle supports dispatch and provision of information to responding personnel.	Existing	ADOT ECD Operational Communications
Arizona Emergency Call-Taking and Dispatch	This service package provides basic public safety call-taking and dispatch services. It includes emergency vehicle equipment, equipment used to receive and route emergency calls, and wireless communications that enable safe and rapid deployment of appropriate resources to an emergency. Coordination between Emergency Management Centers supports emergency notification between agencies. Wide area wireless communications between the Emergency Management Center and an Emergency Vehicle supports dispatch and provision of information to responding personnel.	Existing	Cities and Towns Police and Fire Dispatch

Arizona Evacuation and Reentry Management	This service package supports evacuation of the general public from a disaster area and manages subsequent reentry to the disaster area. The service package addresses evacuations for all types of disasters, including disasters like hurricanes that are anticipated and occur slowly, allowing a well-planned orderly evacuation, as well as disasters like terrorist acts that occur rapidly, without warning, and allow little or no time for preparation or public warning.This service package supports coordination of evacuation plans among the federal, state, and local transportation, emergency, and law enforcement agencies that may be involved in a large-scale evacuation. All affected jurisdictions (e.g., states and counties) at the evacuation origin, evacuation destination, and along the evacuation route are informed of the plan. Information is shared with traffic management agencies to implement special traffic control strategies and to control evacuation traffic, including traffic on local streets and arterials as well as the major evacuation routes. Reversible lanes, shoulder use, closures, special signal control strategies, and other special strategies may be implemented to maximize capacity along the evacuation routes. Transit resources play an important role in an evacuation, removing many people from an evacuated area while making efficient use of limited capacity. Additional shared transit resources may be added and managed in evacuation scenarios. Resource requirements are forecast based on the evacuation plans, and the necessary resources are located, shared between agencies if necessary, and deployed at the right locations at the appropriate times.Evacuations are also supported by EM10, the "Disaster Traveler Information" service package, which keeps the public informed during evacuations. See that service package for more information.	Existing	ADOT 511 Website

Transit resources play an important role in an evacuation, removing many people from an evacuated area while making efficient use of limited capacity. Additional shared transit resources may be added and managed in evacuation scenarios. Resource requirements are forecast based on the evacuation plans, and the necessary resources are located, shared between agencies if necessary, and deployed at the right locations at the appropriate times.Evacuations are also supported by EM10, the "Disaster Traveler Information" service package, which keeps the public informed during evacuations. See that service package for more information.	Existing	ATTP Tribal Coordination Website

Service Package Name	Service Package Description	Service Package Status	Included Elements
Arizona Evacuation and Reentry Management	This service package supports evacuation of the general public from a disaster area and manages subsequent reentry to the disaster area. The service package addresses evacuations for all types of disasters, including disasters like hurricanes that are anticipated and occur slowly, allowing a well-planned orderly evacuation, as well as disasters like terrorist acts that occur rapidly, without warning, and allow little or no time for preparation or public warning.This service package supports coordination of evacuation plans among the federal, state, and local transportation, emergency, and law enforcement agencies that may be involved in a large-scale evacuation. All affected jurisdictions (e.g., states and counties) at the evacuation origin, evacuation destination, and along the evacuation route are informed of the plan. Information is shared with traffic management agencies to implement special traffic control strategies and to control evacuation traffic, including traffic on local streets and arterials as well as the major evacuation routes. Reversible lanes, shoulder use, closures, special signal control strategies, and other special strategies may be implemented to maximize capacity along the evacuation routes. Transit resources play an important role in an evacuation, removing many people from an evacuated area while making efficient use of limited capacity. Additional shared transit resources may be added and managed in evacuation scenarios. Resource requirements are forecast based on the evacuation plans, and the necessary resources are located, shared between agencies if necessary, and deployed at the right locations at the appropriate times.Evacuations are also supported by EM10, the "Disaster Traveler Information" service package, which keeps the public informed during evacuations. Transit resources play an important role in an evacuation, removing many people from an evacuated area while making efficient use of limited capacity. Additional shared transit resources may be added and managed in evacuation scenarios. Resource requirements are forecast based on the evacuation plans, and the necessary resources are located, shared between agencies if necessary, and deployed at the right locations at the appropriate times.Evacuations are also supported by EM10, the "Disaster Traveler Information" service package, which keeps the public informed during evacuations. See that service package for more information.	Existing	DEMA WebEOC System

Service Package Name	Service Package Description	Service Package Status	Included Elements
Arizona Evacuation and Reentry Management	This service package supports evacuation of the general public from a disaster area and manages subsequent reentry to the disaster area. The service package addresses evacuations for all types of disasters, including disasters like hurricanes that are anticipated and occur slowly, allowing a well-planned orderly evacuation, as well as disasters like terrorist acts that occur rapidly, without warning, and allow little or no time for preparation or public warning.This service package supports coordination of evacuation plans among the federal, state, and local transportation, emergency, and law enforcement agencies that may be involved in a large-scale evacuation. All affected jurisdictions (e.g., states and counties) at the evacuation origin, evacuation destination, and along the evacuation route are informed of the plan. Information is shared with traffic management agencies to implement special traffic control strategies and to control evacuation traffic, including traffic on local streets and arterials as well as the major evacuation routes. Reversible lanes, shoulder use, closures, special signal control strategies, and other special strategies may be implemented to maximize capacity along the evacuation routes. Transit resources play an important role in an evacuation, removing many people from an evacuated area while making efficient use of limited capacity. Additional shared transit resources may be added and managed in evacuation scenarios. Resource requirements are forecast based on the evacuation plans, and the necessary resources are located, shared between agencies if necessary, and deployed at the right locations at the appropriate times.Evacuations are also supported by EM10, the "Disaster Traveler Information" service package, which keeps the public informed during evacuations. Transit resources play an important role in an evacuation, removing many people from an evacuated area while making efficient use of limited capacity. Additional shared transit resources may be added and managed in evacuation scenarios. Resource requirements are forecast based on the evacuation plans, and the necessary resources are located, shared between agencies if necessary, and deployed at the right locations at the appropriate times.Evacuations are also supported by EM10, the "Disaster Traveler Information" service package, which keeps the public informed during evacuations. See that service package for more information.	Existing	Tribal TMC-TOC-TIC

Service Package Name	Service Package Description	Service Package Status	Included Elements
Arizona Evacuation and Reentry Management	This service package supports evacuation of the general public from a disaster area and manages subsequent reentry to the disaster area. The service package addresses evacuations for all types of disasters, including disasters like hurricanes that are anticipated and occur slowly, allowing a well-planned orderly evacuation, as well as disasters like terrorist acts that occur rapidly, without warning, and allow little or no time for preparation or public warning.This service package supports coordination of evacuation plans among the federal, state, and local transportation, emergency, and law enforcement agencies that may be involved in a large-scale evacuation. All affected jurisdictions (e.g., states and counties) at the evacuation origin, evacuation destination, and along the evacuation route are informed of the plan. Information is shared with traffic management agencies to implement special traffic control strategies and to control evacuation traffic, including traffic on local streets and arterials as well as the major evacuation routes. Reversible lanes, shoulder use, closures, special signal control strategies, and other special strategies may be implemented to maximize capacity along the evacuation routes. Transit resources play an important role in an evacuation, removing many people from an evacuated area while making efficient use of limited capacity. Additional shared transit resources may be added and managed in evacuation scenarios. Resource requirements are forecast based on the evacuation plans, and the necessary resources are located, shared between agencies if necessary, and deployed at the right locations at the appropriate times.Evacuations are also supported by EM10, the "Disaster Traveler Information" service package, which keeps the public informed during evacuations. Arizona Integrated Multi-Modal Electronic Payment	--Instance of TI05-- The Integrated Multi-Modal Electronic Payment (IMMEP) service package provides electronic payment capability for transit fares, tolls, road use, parking, and other areas requiring electronic payments. IMMEP enables the provision of payment for transportation services using a single account for multiple public transportation providers. The transportation user establishes an account with a financial service provider (modeled as the Payment Administration Center (PAC)), and the PAC communicates with various public transportation providers to coordinate charges. IMMEP also supports the management of transportation user access rights (i.e., this user can use the subway but not the bus). Payment transactions are centralized; the user provides only a secure, registered token (the 'secureID') to the transportation provider's access control equipment. The transportation provider uses that token and context to initiate transactions with the PAC.	Planned	Cities and Towns Transit Dispatch

Planned	Private Transit Routing Service Provider
Arizona Queue Warning	This service package utilizes connected vehicle technologies, including vehicle-to-infrastructure (V2I) and vehicle-to-vehicle (V2V) communications, to enable vehicles within the queue event to automatically broadcast their queued status information (e.g., rapid deceleration, disabled status, lane location) to nearby upstream vehicles and to centers (such as the TMC). The infrastructure will broadcast queue warnings to vehicles in order to minimize or prevent rear-end or other secondary collisions. This service package is not intended to operate as a crash avoidance system. In contrast to such systems, this service package will engage well in advance of any potential crash situation, providing messages and information to the driver in order to minimize the likelihood of his needing to take crash avoidance or mitigation actions later.It performs two essential tasks: queue determination (detection and/or prediction) and queue information dissemination using vehicle-based, infrastructure-based, or hybrid solutions.	Planned	ADOT CV Roadside Equipment

Service Package Name	Service Package Description	Service Package Status	Included Elements
Arizona Road Weather Motorist Alert and Warning	This service package collects road weather data from connected vehicles and uses that data to develop short term warnings or advisories that can be provided to individual motorists. The information may come from either vehicles operated by the general public and commercial entities (including passenger cars and trucks) or specialty vehicles and public fleet vehicles (such as snowplows, maintenance trucks, and other agency pool vehicles). The raw data will be processed in a controlling center to generate road segment-based data outputs. The processing will also include a road weather motorist alerts algorithm to generate short time horizon alerts that will be pushed to user systems and available to commercial service providers. In addition the information collected can be combined with observations and forecasts from other sources to provide medium (next 2-12 hours) or long term (more than 12 hours) advisories through a variety of interfaces including web based and connected vehicle based interfaces.	Planned	ADOT CV Roadside Equipment

Planned	Wide Area Alerting Systems
Arizona Smart Roadside and Virtual WIM	This service package includes the delivery of capabilities related to wireless roadside inspections and electronic screening/virtual weigh stations. Wireless roadside inspection is defined by a safety screening capability that employs communications technologies to obtain information from a commercial vehicle that will allow safety screening of the vehicle and its driver. This capability provides for the interrogation at mainline speeds of a commercial vehicle when it has entered a control segment or geofenced area. Vehicle identification and driver information are provided to the roadside unit. The information communicated can be used to verify compliance with safety requirements, allowing a decision to be made regarding whether the vehicle should pull in to a roadside check station. A more advanced version of this service package would download safety information measured on the vehicle including driver related information such as the driver log allowing real time evaluation that the vehicle and driver are meeting safety requirements. The electronic screening/virtual weigh stations capability employs communications technologies to obtain information from a commercial vehicle that will allow verification of permits or credentials for the vehicle. The information communicated is used to verify compliance with safety requirements, allowing a decision to be made regarding whether the vehicle should pull in to a roadside check station. This service package can also be used to verify that the commercial vehicle meets vehicle weight (via weigh in motion capability) or dimension requirements.	Existing	ADOT Electronic Bypass Stations

Existing	Safety Fitness Electronic Record (SAFER)
Arizona Traffic Probe Data	This service package provides an alternative approach for surveillance of the roadway network. Two general implementation paths are supported by this service package: 1) wide-area wireless communications between the vehicle and center is used to communicate vehicle operational information and status directly to the center, and 2) dedicated short range communications between passing vehicles and the roadside is used to provide equivalent information to the center. The first approach leverages wide area communications equipment that may already be in the vehicle to support personal safety and advanced traveler information services. The second approach utilizes vehicle equipment that supports toll collection, in-vehicle signing, and other short range communications applications identified within the architecture. The service package enables transportation operators and traveler information providers to monitor road conditions, identify incidents, analyze and reduce the collected data, and make it available to users and private information providers. It requires one of the communications options identified above, on-board equipment, data reduction software, and fixed-point to fixed-point links between centers to share the collected information. Both “Opt out” and “Opt in” strategies are available to ensure the user has the ability to turn off the probe functions to ensure individual privacy. Due to the large volume of data collected by probes, data reduction techniques are required, such as the ability to identify and filter out-of-bounds or extreme data reports.	Planned	ADOT 511 Website

Due to the large volume of data collected by probes, data reduction techniques are required, such as the ability to identify and filter out-of-bounds or extreme data reports.	Planned	Public Private Traveler Information
Arizona Traffic Probe Data	This service package provides an alternative approach for surveillance of the roadway network. Two general implementation paths are supported by this service package: 1) wide-area wireless communications between the vehicle and center is used to communicate vehicle operational information and status directly to the center, and 2) dedicated short range communications between passing vehicles and the roadside is used to provide equivalent information to the center. The first approach leverages wide area communications equipment that may already be in the vehicle to support personal safety and advanced traveler information services. The second approach utilizes vehicle equipment that supports toll collection, in-vehicle signing, and other short range communications applications identified within the architecture. The service package enables transportation operators and traveler information providers to monitor road conditions, identify incidents, analyze and reduce the collected data, and make it available to users and private information providers. It requires one of the communications options identified above, on-board equipment, data reduction software, and fixed-point to fixed-point links between centers to share the collected information. Both “Opt out” and “Opt in” strategies are available to ensure the user has the ability to turn off the probe functions to ensure individual privacy. Due to the large volume of data collected by probes, data reduction techniques are required, such as the ability to identify and filter out-of-bounds or extreme data reports.	Planned	Wide Area Alerting Systems

Service Package Name	Service Package Description	Service Package Status	Included Elements
Arizona Transit Signal Priority	The Transit Signal Priority service package uses transit vehicle to infrastructure communications to allow a transit vehicle to request priority at one or a series of intersections. The service package provides feedback to the transit driver indicating whether the signal priority has been granted or not. This service package can contribute to improved operating performance of the transit vehicles by reducing the time spent stopped at a red light.	Planned	Cities and Towns ITS Field Equipment
Arizona Transit Signal Priority	The Transit Signal Priority service package uses transit vehicle to infrastructure communications to allow a transit vehicle to request priority at one or a series of intersections. The service package provides feedback to the transit driver indicating whether the signal priority has been granted or not. This service package can contribute to improved operating performance of the transit vehicles by reducing the time spent stopped at a red light.	Planned	Cities and Towns TMC-TOC
Arizona Transit Signal Priority	The Transit Signal Priority service package uses transit vehicle to infrastructure communications to allow a transit vehicle to request priority at one or a series of intersections. The service package provides feedback to the transit driver indicating whether the signal priority has been granted or not. This service package can contribute to improved operating performance of the transit vehicles by reducing the time spent stopped at a red light.	Planned	Cities and Towns Transit Dispatch
Arizona Transit Signal Priority	The Transit Signal Priority service package uses transit vehicle to infrastructure communications to allow a transit vehicle to request priority at one or a series of intersections. The service package provides feedback to the transit driver indicating whether the signal priority has been granted or not. This service package can contribute to improved operating performance of the transit vehicles by reducing the time spent stopped at a red light.	Planned	Cities and Towns Transit Vehicles
Arizona Transit Signal Priority	The Transit Signal Priority service package uses transit vehicle to infrastructure communications to allow a transit vehicle to request priority at one or a series of intersections. The service package provides feedback to the transit driver indicating whether the signal priority has been granted or not. This service package can contribute to improved operating performance of the transit vehicles by reducing the time spent stopped at a red light.	Planned	Transit Providers Dispatch (Public and Private)
Arizona Transit Signal Priority	The Transit Signal Priority service package uses transit vehicle to infrastructure communications to allow a transit vehicle to request priority at one or a series of intersections. The service package provides feedback to the transit driver indicating whether the signal priority has been granted or not. This service package can contribute to improved operating performance of the transit vehicles by reducing the time spent stopped at a red light.	Planned	Transit Providers Vehicles (Public and Private)
Arizona Transit Stop Request	This service package allows a transit passenger to send a stop request to an approaching transit vehicle. The transit vehicle receives the request and notifies the vehicle operator of the stop request.	Planned	Cities and Towns Transit Vehicles

Service Package Name	Service Package Description	Service Package Status	Included Elements
Arizona Transit Stop Request	This service package allows a transit passenger to send a stop request to an approaching transit vehicle. The transit vehicle receives the request and notifies the vehicle operator of the stop request.	Planned	Local Dial-A-Ride Transit Vehicles
Arizona Transit Stop Request	This service package allows a transit passenger to send a stop request to an approaching transit vehicle. The transit vehicle receives the request and notifies the vehicle operator of the stop request.	Planned	NAIPTA (dba Mountain Line) Bus Arrival System
Arizona Transit Stop Request	This service package allows a transit passenger to send a stop request to an approaching transit vehicle. The transit vehicle receives the request and notifies the vehicle operator of the stop request.	Planned	NAIPTA (dba Mountain Line) Paratransit
Arizona Transit Stop Request	This service package allows a transit passenger to send a stop request to an approaching transit vehicle. The transit vehicle receives the request and notifies the vehicle operator of the stop request.	Planned	NAIPTA (dba Mountain Line) Paratransit Vehicles
Arizona Transit Stop Request	This service package allows a transit passenger to send a stop request to an approaching transit vehicle. The transit vehicle receives the request and notifies the vehicle operator of the stop request.	Planned	NAIPTA (dba Mountain Line) Transit Buses
Arizona Transit Stop Request	This service package allows a transit passenger to send a stop request to an approaching transit vehicle. The transit vehicle receives the request and notifies the vehicle operator of the stop request.	Planned	Transit Providers Dispatch (Public and Private)
Arizona Transit Stop Request	This service package allows a transit passenger to send a stop request to an approaching transit vehicle. The transit vehicle receives the request and notifies the vehicle operator of the stop request.	Planned	Transit Providers Vehicles (Public and Private)
Arizona Transit Stop Request	This service package allows a transit passenger to send a stop request to an approaching transit vehicle. The transit vehicle receives the request and notifies the vehicle operator of the stop request.	Planned	Travelers
Arizona Transit Stop Request	This service package allows a transit passenger to send a stop request to an approaching transit vehicle. The transit vehicle receives the request and notifies the vehicle operator of the stop request.	Planned	Tribal Transit Vehicles
Arizona Transit Stop Request	This service package allows a transit passenger to send a stop request to an approaching transit vehicle. The transit vehicle receives the request and notifies the vehicle operator of the stop request.	Planned	YCAT Buses
Arizona Transit Stop Request	This service package allows a transit passenger to send a stop request to an approaching transit vehicle. The transit vehicle receives the request and notifies the vehicle operator of the stop request.	Planned	YCAT Transit Passes
Arizona Transit Stop Request	This service package allows a transit passenger to send a stop request to an approaching transit vehicle. The transit vehicle receives the request and notifies the vehicle operator of the stop request.	Planned	Yuma County Area Transit (YCAT)

Service Package Name	Service Package Description	Service Package Status	Included Elements
Arizona Transportation Infrastructure Protection	This service package includes the monitoring of transportation infrastructure (e.g., bridges, tunnels and management centers) for potential threats using sensors and surveillance equipment and barrier and safeguard systems to control access, preclude an incident, and mitigate the impact of an incident if it occurs. Threats can result from acts of nature (e.g., hurricanes, earthquakes), terrorist attacks or other incidents causing damage to the infrastructure (e.g., stray barge hitting a bridge support). Infrastructure may be monitored with acoustic, environmental threat (such as nuclear, biological, chemical, and explosives), infrastructure condition and integrity, motion and object sensors and video and audio surveillance equipment. Data from such sensors and surveillance equipment may be processed in the field or sent to a center for processing. The data enables operators at the center to detect and verify threats. When a threat is detected, agencies are notified. Detected threats or advisories received from other agencies result in an increased level of system preparedness. In response to threats, barrier and safeguard systems may be activated by Traffic Management Subsystems to deter an incident, control access to an area or mitigate the impact of an incident. Barrier systems include gates, barriers and other automated and remotely controlled systems that manage entry to transportation infrastructure. Safeguard systems include blast shields, exhaust systems and other automated and remotely controlled systems that mitigate impact of an incident.	Planned	ADOT DEOC-Dept EM Ops Center

Service Package Name	Service Package Description	Service Package Status	Included Elements
Arizona Trip Planning and Payment	--Instance of TI04-- This service package offers the user trip planning and pre-trip guidance services. It generates a trip plan, including a multimodal route and associated service information (e.g., parking information), based on traveler preferences and constraints. Routes may be based on static information or reflect real time network conditions. Unlike TI03, where the user equipment determines the route, the route determination functions are performed by the center in this service package. The trip plan may be confirmed by the traveler and advanced payment and reservations for transit and alternate mode (e.g., airline, rail, and ferry) trip segments, and ancillary services are accepted and processed. The confirmed trip plan may include specific routing information that can be supplied to the traveler as general directions or as turn-by-turn route guidance depending on the level of user equipment.	Planned	Cities and Towns Transit Dispatch
Arizona Trip Planning and Payment	--Instance of TI04-- This service package offers the user trip planning and pre-trip guidance services. Planned	Yuma County Area Transit (YCAT)
Arizona Universities Data Warehouse	This service package provides access to transportation data to support transportation planning, condition and performance monitoring, safety analysis, and research. Configurations range from focused repositories that house data collected and owned by a single agency, district, private sector provider, or research institution to broad repositories that contain multimodal, multidimensional data from varied data sources covering a broader region. Both central repositories and physical distributed ITS data repositories are supported. Requests for data that are satisfied by access to a single repository in the ITS Data Warehouse service package may be parsed by the local repository and dynamically translated to requests to other repositories that relay the data necessary to satisfy the request.	Existing	ADOT AZ Crash Information System (ACIS)

Arizona V2V Basic Safety	This service package exchanges basic safety messages with surrounding Connected Vehicles to support and augment the safety warning and control automation features identified in VS01. These exchanges support Connected Vehicle safety applications defined in SAE J2945/1: Emergency Electronic Brake Lights, Forward Crash Warning, Blind Spot Warning/Lane Change Warning, Intersection Movement Assist, Left Turn Assist, and Control Loss Warning. It also supports Do Not Pass Warning, Motorcycle Approaching indication, Tailgating Advisory, Stationary Vehicle, and Pre-Crash Actions applications from CVRIA.	Planned	Basic Private Vehicle
Arizona V2V Special Vehicle Alert	This service package alerts the driver about the location of and the movement of public safety vehicles responding to an incident, slow moving vehicles, oversized vehicles, and other special vehicles that may require special attention from the driver. These public safety, commercial, and maintenance vehicles share their current status and location with surrounding vehicles so that other drivers in the vicinity can avoid interfering with their actions and avoid collisions.	Planned	Commercial Vehicles
Arizona V2V Special Vehicle Alert	This service package alerts the driver about the location of and the movement of public safety vehicles responding to an incident, slow moving vehicles, oversized vehicles, and other special vehicles that may require special attention from the driver. These public safety, commercial, and maintenance vehicles share their current status and location with surrounding vehicles so that other drivers in the vicinity can avoid interfering with their actions and avoid collisions.	Planned	DPS RMA Vehicles

These public safety, commercial, and maintenance vehicles share their current status and location with surrounding vehicles so that other drivers in the vicinity can avoid interfering with their actions and avoid collisions.	Planned	Emergency Medical Transport/Ambulances
Arizona V2V Special Vehicle Alert	This service package alerts the driver about the location of and the movement of public safety vehicles responding to an incident, slow moving vehicles, oversized vehicles, and other special vehicles that may require special attention from the driver. These public safety, commercial, and maintenance vehicles share their current status and location with surrounding vehicles so that other drivers in the vicinity can avoid interfering with their actions and avoid collisions.	Planned	Transit Providers Vehicles (Public and Private)
Arizona Wrong Way Vehicle Detection and Warning	This service package detects wrong way vehicles on the main roadway and at the exit of divided freeways, tunnels, and bridges. Wrong way vehicle drivers are immediately warned. If the driver continues onto the roadway, warnings are issued to oncoming drivers of the wrong way entry and traffic management and public safety centers are notified.	Existing	ADOT TOC and EMC
Arizona Wrong Way Vehicle Detection and Warning	This service package detects wrong way vehicles on the main roadway and at the exit of divided freeways, tunnels, and bridges. Wrong way vehicle drivers are immediately warned. If the driver continues onto the roadway, warnings are issued to oncoming drivers of the wrong way entry and traffic management and public safety centers are notified.	Existing	ADOT Wrong Way Driver Detection System
Arizona Wrong Way Vehicle Detection and Warning	This service package detects wrong way vehicles on the main roadway and at the exit of divided freeways, tunnels, and bridges. Wrong way vehicle drivers are immediately warned. If the driver continues onto the roadway, warnings are issued to oncoming drivers of the wrong way entry and traffic management and public safety centers are notified.	Existing	DPS Central Communications Center

Service Package Name	Service Package Description	Service Package Status	Included Elements
Automatic Vehicle Mayday Notification	This service package provides the capability for a vehicle to automatically transmit an emergency message when the vehicle has been involved in a crash or other distress situation. An automatic crash notification feature transmits key data on the crash recorded by sensors mounted in the vehicle (e.g. deployment of airbags) without the need for involvement of the driver. The emergency message is sent to emergency response services, which determines and carries out the appropriate response. This service package allows passing vehicles to receive and forward mayday requests in areas where no communications infrastructure exists. Emergency notifications from personal devices are also supported.	Existing	DPS Central Communications Center
Automatic Vehicle Mayday Notification	This service package provides the capability for a vehicle to automatically transmit an emergency message when the vehicle has been involved in a crash or other distress situation. An automatic crash notification feature transmits key data on the crash recorded by sensors mounted in the vehicle (e.g. deployment of airbags) without the need for involvement of the driver. The emergency message is sent to emergency response services, which determines and carries out the appropriate response. This service package allows passing vehicles to receive and forward mayday requests in areas where no communications infrastructure exists. Emergency notifications from personal devices are also supported.	Existing	DPS Console Interface (Other LE)

AZ Electric Vehicle Charging Stations Management	--Instance of ST05-- The Electric Charging Station Management service package provides an exchange of information between the electric vehicle and charging station to manage the charging operation. The service package also supports interaction between a traveler in a vehicle and a transportation information center in order to plan a trip that will involve requesting locations and availability of charging stations as well as reserving a spot at a charging station if needed. The agency or company operating the charging station can use vehicle information such as the capability of the vehicle (e.g. operational status of the electrical system, how many amps can the vehicle handle, and % charge complete) to determine that the charge is being properly applied and determine an estimated time to complete charging.	Planned	Basic Private Vehicle

Service Package Name	Service Package Description	Service Package Status	Included Elements

AZ Mexico Border Management Systems	This service package provides international border crossing management for passenger vehicles and other non-commercial travelers crossing the border. This service package manages traffic at the border crossing, provides technology to support expedited processing of trusted travelers, and collects and disseminates border wait times.	Existing	US VISIT System
AZ Statewide Broadcast Traveler Information (Inputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	ADEQ Arizona Emissions Management
AZ Statewide Broadcast Traveler Information (Inputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. AZ Statewide Broadcast Traveler Information (Inputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	NOAA _National Weather Service

Service Package Name	Service Package Description	Service Package Status	Included Elements
AZ Statewide Broadcast Traveler Information (Inputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	Public Private Traveler Information
AZ Statewide Broadcast Traveler Information (Inputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	Tribal MCO Dispatch
AZ Statewide Broadcast Traveler Information (Inputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	Tribal Public Safety Dispatch

Service Package Name	Service Package Description	Service Package Status	Included Elements
AZ Statewide Broadcast Traveler Information (Inputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	Tribal TMC-TOC-TIC
AZ Statewide Broadcast Traveler Information (Inputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	US Border Patrol Dispatch
AZ Statewide Broadcast Traveler Information (Inputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	US VISIT System

Service Package Name	Service Package Description	Service Package Status	Included Elements
AZ Statewide Broadcast Traveler Information (Inputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	Wide Area Alerting Systems
AZ Statewide Broadcast Traveler Information (Outputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	ADOT 511 Website
AZ Statewide Broadcast Traveler Information (Outputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	ADOT AZ 511 App

Service Package Name	Service Package Description	Service Package Status	Included Elements
AZ Statewide Broadcast Traveler Information (Outputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	ADOT HazMat Response Team
AZ Statewide Broadcast Traveler Information (Outputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	ADOT Regional Traffic Operations
AZ Statewide Broadcast Traveler Information (Outputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	ADOT TOC Traffic Information Center

Service Package Name	Service Package Description	Service Package Status	Included Elements
AZ Statewide Broadcast Traveler Information (Outputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	ATTP Tribal Coordination Website
AZ Statewide Broadcast Traveler Information (Outputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	BIA Western Regional Website
AZ Statewide Broadcast Traveler Information (Outputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	CBP Website

Service Package Name	Service Package Description	Service Package Status	Included Elements
AZ Statewide Broadcast Traveler Information (Outputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	Cities and Towns TIC and Website
AZ Statewide Broadcast Traveler Information (Outputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	County Website and NIXLE
AZ Statewide Broadcast Traveler Information (Outputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Different from the service package ATMS06 - Traffic Information Dissemination, which provides localized HAR and DMS information capabilities, ATIS01 provides a wide area digital broadcast service. Successful deployment of this service package relies on availability of real-time traveler information from roadway instrumentation, probe vehicles or other sources.	Planned	Local Print and Broadcast Media

Service Package Name	Service Package Description	Service Package Status	Included Elements
AZ Statewide Broadcast Traveler Information (Outputs)	This service package collects traffic conditions, advisories, general public transportation, toll and parking information, incident information, roadway maintenance and construction information, air quality and weather information, and broadcasts the information to travelers using technologies such as FM subcarrier, satellite radio, cellular data broadcasts, and Internet web casts. The information may be provided directly to travelers or provided to merchants and other traveler service providers so that they can better inform their customers of travel conditions. Existing	AZTech Regional Info System (ARIS)
Cities and Town Transit Fare Collection	This service package manages transit fare collection on-board transit vehicles and at transit stops using electronic means. It allows transit users to use a traveler card or other electronic payment device. Readers located either in the infrastructure or on-board the transit vehicles enable electronic fare payment. Data is processed, stored, and displayed on the transit vehicle and communicated as needed to the Transit Management Subsystem. Two other service packages, ATMS10: Electronic Toll Collection and ATMS16: Parking Facility Management, also provide electronic payment services. These three service packages in combination provide an integrated electronic payment system for transportation services.	Planned	Cities and Towns Transit Dispatch
Cities and Town Transit Fare Collection	This service package manages transit fare collection on-board transit vehicles and at transit stops using electronic means. It allows transit users to use a traveler card or other electronic payment device. Readers located either in the infrastructure or on-board the transit vehicles enable electronic fare payment. Data is processed, stored, and displayed on the transit vehicle and communicated as needed to the Transit Management Subsystem. Cities and Towns Infrastructure-Based Traffic Surveillance	This service package includes traffic detectors, other surveillance equipment, the supporting field equipment, and Center to Field communications to transmit the collected data back to the Traffic Management Center. The derived data can be used locally such as when traffic detectors are connected directly to a signal control system or remotely (e.g., when a CCTV system sends data back to the Traffic Management Center). The data generated by this service package enables traffic managers to monitor traffic and road conditions, identify and verify incidents, detect faults in indicator operations, and collect census data for traffic strategy development and long range planning. The collected data can also be analyzed and made available to users and the Traveler Information Center physical object.	Existing	ADOT 511 Website

Service Package Name	Service Package Description	Service Package Status	Included Elements
Cities and Towns Maintenance and Construction	This service package supports numerous services for scheduled and unscheduled maintenance and construction on a roadway system or right-of-way. Maintenance services include landscape maintenance, hazard removal (roadway debris, dead animals), routine maintenance activities (roadway cleaning, grass cutting), and repair and maintenance of both ITS and non-ITS equipment on the roadway (e.g., signs, traffic controllers, traffic detectors, dynamic message signs, traffic signals, CCTV, etc.). Environmental conditions information is also received from various weather sources to aid in scheduling maintenance and construction activities.	Existing	Cities and Towns ITS Field Equipment

Cities and Towns Transit Fleet Management	This service package supports automatic transit maintenance scheduling and monitoring. On-board condition sensors monitor system status and transmit critical status information to the Transit Management Center. The Transit Management Center processes this data and schedules preventative and corrective maintenance. The service package also supports the day to day management of the transit fleet inventory, including the assignment of specific transit vehicles to blocks.	Planned	Cities and Towns Transit Dispatch

The service package also supports the day to day management of the transit fleet inventory, including the assignment of specific transit vehicles to blocks.	Planned	Cities and Towns Transit Vehicles
Cities and Towns Transit Passenger Counting	This service package counts the number of passengers entering and exiting a transit vehicle using sensors mounted on the vehicle and communicates the collected passenger data back to the management center. The collected data can be used to calculate reliable ridership figures and measure passenger load information at particular stops.	Planned	Cities and Towns Transit Dispatch
Cities and Towns Transit Passenger Counting	This service package counts the number of passengers entering and exiting a transit vehicle using sensors mounted on the vehicle and communicates the collected passenger data back to the management center. The collected data can be used to calculate reliable ridership figures and measure passenger load information at particular stops.	Planned	Cities and Towns Transit Vehicles
Cities and Towns Transit Security	This service package provides for the physical security of transit passengers and transit vehicle operators. On-board equipment performs surveillance and sensor monitoring in order to identify potentially hazardous situations. The surveillance equipment includes video (e.g., CCTV cameras), audio systems and/or event recorder systems. The sensor equipment includes threat sensors (e.g., chemical agent, toxic industrial chemical, biological, explosives, and radiological sensors) and object detection sensors (e.g., metal detectors). Transit user or transit vehicle operator activated alarms are provided on-board. Public areas (e.g., transit stops, park and ride lots, stations) are also monitored with similar surveillance and sensor equipment and provided with transit user activated alarms. In addition this service package provides surveillance and sensor monitoring of non-public areas of transit facilities (e.g., transit yards) and transit infrastructure such as bridges, tunnels, and transit railways or bus rapid transit (BRT) guideways. The surveillance equipment includes video and/or audio systems. The sensor equipment includes threat sensors and object detection sensors as described above as well as, intrusion or motion detection sensors and infrastructure integrity monitoring (e.g., rail track continuity checking or bridge structural integrity monitoring).Most of the surveillance and sensor data that is collected by this service package may be monitored by either the Emergency Management Center or the Transit Management Center, providing two possible approaches to implementing this service package. This service package also supports remote transit vehicle disabling and transit vehicle operator authentication by the Transit Management Center.	Planned	Cities and Towns Transit Dispatch

Cities and Towns Weather Info Processing and Distribution	This service package processes and distributes the environmental information collected from the Weather Data Collection service package. This service package uses the environmental data to detect environmental hazards such as icy road conditions, high winds, dense fog, etc. so operational centers and decision support systems can make decision on corrective actions to take. The continuing updates of road condition information and current temperatures can be used to more effectively deploy road maintenance resources, issue general traveler advisories, issue location specific warnings to drivers using the Traffic Information Dissemination service package, and aid operators in scheduling work activity.	Planned	ADOT 511 Website

Planned	Wide Area Alerting Systems
Cities and Towns Work Zone Management	This service package manages work zones, controlling traffic in areas of the roadway where maintenance, construction, and utility work activities are underway. Traffic conditions are monitored using CCTV cameras and controlled using dynamic message signs (DMS), Highway Advisory Radio (HAR), gates and barriers. Work zone information is coordinated with other groups (e.g., TIC, traffic management, other maintenance and construction centers). Work zone speeds and delays are provided to the motorist prior to the work zones. This service package provides control of field equipment in all maintenance and construction areas, including fixed, portable, and truck-mounted devices supporting both stationary and mobile work zones.	Planned	Cities and Towns ITS Field Equipment

Cities Towns and Counties Emergency Response	This service package manages both unexpected incidents and planned events so that the impact to the transportation network and traveler safety is minimized. The service package includes incident detection capabilities through roadside surveillance devices (e.g. CCTV) and through regional coordination with other traffic management, maintenance and construction management and emergency management centers as well as rail operations and event promoters. Information from these diverse sources is collected and correlated by this service package to detect and verify incidents and implement an appropriate response. This service package supports traffic operations personnel in developing an appropriate response in coordination with emergency management, maintenance and construction management, and other incident response personnel to confirmed incidents. The response may include traffic control strategy modifications or resource coordination between centers. Incident response also includes presentation of information to affected travelers using the Traffic Information Dissemination service package and dissemination of incident information to travelers through the Broadcast Traveler Information or Interactive Traveler Information service packages. The roadside equipment used to detect and verify incidents also allows the operator to monitor incident status as the response unfolds. The coordination with emergency management might be through a CAD system or through other communication with emergency field personnel. The coordination can also extend to tow trucks and other allied response agencies and field service personnel.	Planned	Cities and Towns EOC-EMC

Cities Towns and Counties Emergency Vehicle Preemption	This service package provides signal preemption for public safety first responder vehicles. Both traditional signal preemption systems and new systems based on connected vehicle technology are covered. In more advanced systems, movement of public safety vehicles through the intersection can be facilitated by clearing queues and holding conflicting phases. In addition, this SP also covers the transition back to normal traffic signal operations after providing emergency vehicle preemption.	Existing	Cities and Towns ITS Field Equipment

Cities Towns and Counties Parking Space Management	This service package monitors and manages parking spaces in lots, garages, and other parking areas and facilities. It assists in the management of parking operations by monitoring parking lot ingress and egress, parking space occupancy and availability. Infrastructure-based detectors and/or connected vehicles may be used to monitor parking occupancy. The service package shares collected parking information with local drivers and information providers for broader distribution.	Planned	Cities and Towns TIC and Website
Cities Towns and Counties Parking Space Management	This service package monitors and manages parking spaces in lots, garages, and other parking areas and facilities. It assists in the management of parking operations by monitoring parking lot ingress and egress, parking space occupancy and availability. Infrastructure-based detectors and/or connected vehicles may be used to monitor parking occupancy. The service package shares collected parking information with local drivers and information providers for broader distribution.	Planned	Cities and Towns TMC-TOC
Cities Towns and Counties Parking Space Management	This service package monitors and manages parking spaces in lots, garages, and other parking areas and facilities. It assists in the management of parking operations by monitoring parking lot ingress and egress, parking space occupancy and availability. Infrastructure-based detectors and/or connected vehicles may be used to monitor parking occupancy. The service package shares collected parking information with local drivers and information providers for broader distribution.	Planned	Private Vehicle OBE
Cities Towns and Counties Parking Space Management	This service package monitors and manages parking spaces in lots, garages, and other parking areas and facilities. It assists in the management of parking operations by monitoring parking lot ingress and egress, parking space occupancy and availability. Infrastructure-based detectors and/or connected vehicles may be used to monitor parking occupancy. The service package shares collected parking information with local drivers and information providers for broader distribution.	Planned	Public Private Traveler Information
Cities Towns and Counties Speed Warning and Enforcement	This service package monitors vehicle speeds and supports warning drivers when their speed is excessive. Also the service includes notifications to an enforcement agency to enforce the speed limit of the roadway. Speed monitoring can be made via spot speed or average speed measurements. Roadside equipment can display the speed of passing vehicles and/or suggest a safe driving speed. Environmental conditions and vehicle characteristics may be monitored and factored into the safe speed advisories that are provided to the motorist. For example, warnings can be generated recognizing the limitations of a given vehicle for the geometry of the roadway such as rollover risk for tall vehicles. This service focuses on monitoring of vehicle speeds and enforcement of the speed limit while the variable speed limits service (covered in TM20-Variable Speed Limits service package) focuses on varying the posted speed limits to create more uniform speeds along a roadway, to promote safer driving during adverse conditions (such as fog) and/or to reduce air pollution.	Planned	Cities and Towns ITS Field Equipment

Cities Towns and Counties Traffic Incident Management System	This service package manages both unexpected incidents and planned events so that the impact to the transportation network and traveler safety is minimized. The service package includes incident detection capabilities through roadside surveillance devices (e.g. CCTV) and through regional coordination with other traffic management, maintenance and construction management and emergency management centers as well as rail operations and event promoters. Information from these diverse sources is collected and correlated by this service package to detect and verify incidents and implement an appropriate response. This service package supports traffic operations personnel in developing an appropriate response in coordination with emergency management, maintenance and construction management, and other incident response personnel to confirmed incidents. The response may include traffic control strategy modifications or resource coordination between centers. Incident response also includes presentation of information to affected travelers using the Traffic Information Dissemination service package and dissemination of incident information to travelers through the Broadcast Traveler Information or Interactive Traveler Information service packages. The roadside equipment used to detect and verify incidents also allows the operator to monitor incident status as the response unfolds. The coordination with emergency management might be through a CAD system or through other communication with emergency field personnel. The coordination can also extend to tow trucks and other allied response agencies and field service personnel.	Planned	Cities and Towns EOC-EMC

Service Package Name	Service Package Description	Service Package Status	Included Elements
Cities Towns and Counties Weather Data Collection	This service package collects current road and weather conditions using data collected from environmental sensors deployed on and about the roadway. It also collects data from vehicles in the road network that can be used to directly measure or infer current environmental conditions. It leverages vehicle on-board systems that measure temperature, sense current weather conditions (rain and sun sensors) and also can monitor aspects of the vehicle operational status (e.g., use of headlights, wipers, and traction control system) to gather information about local environmental conditions. In addition, environmental sensor systems located on Maintenance and Construction Vehicles are also potential data sources. The collected environmental data is used by the Weather Information Processing and Distribution service package to process the information and make decisions on operations. The collected environmental data may be aggregated, combined with data attributes and sent to meteorological systems for data qualification and further data consolidation. The service package may also request and receive qualified data sets from meteorological systems.	Existing	Cities and Towns ITS Field Equipment

Cities Towns and Counties Weather Data Collection	This service package collects current road and weather conditions using data collected from environmental sensors deployed on and about the roadway. It also collects data from vehicles in the road network that can be used to directly measure or infer current environmental conditions. It leverages vehicle on-board systems that measure temperature, sense current weather conditions (rain and sun sensors) and also can monitor aspects of the vehicle operational status (e.g., use of headlights, wipers, and traction control system) to gather information about local environmental conditions. In addition, environmental sensor systems located on Maintenance and Construction Vehicles are also potential data sources. The collected environmental data is used by the Weather Information Processing and Distribution service package to process the information and make decisions on operations. The collected environmental data may be aggregated, combined with data attributes and sent to meteorological systems for data qualification and further data consolidation. The service package may also request and receive qualified data sets from meteorological systems.	Existing	County TMC-TOC

Cities, Counties, and Towns Railroad Grade Crossing	This service package manages highway traffic at highway-rail intersections (HRIs) where operational requirements do not dictate more advanced features (e.g., where rail operational speeds are less than 80 miles per hour). Both passive (e.g., the crossbuck sign) and active warning systems (e.g., flashing lights and gates) are supported. (Note that passive systems exercise only the single interface between the ITS Roadway Equipment and the Driver in the physical view.) These traditional HRI warning systems may also be augmented with other standard traffic management devices. The warning systems are activated on notification of an approaching train by interfaced wayside equipment. The equipment at the HRI may also be interconnected with adjacent signalized intersections so that local control can be adapted to highway-rail intersection activities. Health monitoring of the HRI equipment and interfaces is performed; detected abnormalities are reported to both highway and railroad officials through wayside interfaces and interfaces to the Traffic Management Center.	Planned	Cities and Towns ITS Field Equipment

City and County Traffic Signal Control	This service package provides the central control and monitoring equipment, communication links, and the signal control equipment that support traffic control at signalized intersections. A range of traffic signal control systems are represented by this service package ranging from fixed-schedule control systems to fully traffic responsive systems that dynamically adjust control plans and strategies based on current traffic conditions and priority requests. This service package is generally an intra-jurisdictional package. Systems that achieve coordination across jurisdictions by using a common time base or other strategies that do not require real time coordination would also be represented by this package. Coordination of traffic signal systems using real-time communications is covered in the TM07-Regional Traffic Management service package. This service package is consistent with typical traffic signal control systems.	Existing	Cities and Towns ITS Field Equipment

City and Towns Transit Services	This service package monitors current transit vehicle location using an Automated Vehicle Location System. The location data may be used to determine real time schedule adherence and update the transit system's schedule in real-time. Vehicle position may be determined either by the vehicle (e.g., through GPS) and relayed to the infrastructure or may be determined directly by the communications infrastructure. A two-way wireless communication link with the Transit Management Subsystem is used for relaying vehicle position and control measures. Fixed route transit systems may also employ beacons along the route to enable position determination and facilitate communications with each vehicle at fixed intervals. The Transit Management Subsystem processes this information, updates the transit schedule and makes real-time schedule information available to the Information Service Provider.	Planned	Cities and Towns Transit Dispatch

City Town and County IDS and Demand Management	This service package recommends courses of action to transportation operators in a corridor, downtown area, or other heavily traveled area. Recommendations are based on an assessment of current and forecast transportation network performance and environmental conditions using integrated decision support (IDS). Multi-modal transportation operational strategies are created that consider all modes and all roads in the travel area to correct network imbalances and effectively manage available capacity. As part of the operational strategies, this service package may also recommend lane restrictions, transit, parking, and toll strategies to influence traveler route and mode choices to support active demand management programs and policies managing both traffic and the environment. Operational strategies, including demand management recommendations, are coordinated to support operational decisions by each transportation operator that are consistent with the recommended strategy. All recommended operational strategies are based on historical evaluation, real-time assessment, and forecast of the roadway network performance based on predicted travel demand patterns. This service package also collects air quality, parking availability, transit usage, and vehicle occupancy data to support operational strategies that manage and balance capacity and demand.	Planned	Cities and Towns Public Works

Planned	Public Private Traveler Information
City Town and County Traffic Information Dissemination	This service package provides driver information using roadway equipment such as dynamic message signs or highway advisory radio. A wide range of information can be disseminated including traffic and road conditions, closure and detour information, travel restrictions, incident information, and emergency alerts and driver advisories. This package provides information to drivers at specific equipped locations on the road network. Careful placement of the roadway equipment provides the information at points in the network where the drivers have recourse and can tailor their routes to account for the new information. This package also covers the equipment and interfaces that provide traffic information from a traffic management center to the media (for instance via a direct tie-in between a traffic management center and radio or television station computer systems), Transit Management, Emergency Management, and Transportation Information Centers. A link to the Maintenance and Construction Management Center allows real time information on road/bridge closures and restrictions due to maintenance and construction activities to be disseminated.	Planned	ADOT 511 Website

Service Package Name	Service Package Description	Service Package Status	Included Elements
Commercial Vehicle Data Warehouse	This service package provides access to transportation data to support transportation planning, condition and performance monitoring, safety analysis, and research. Configurations range from focused repositories that house data collected and owned by a single agency, district, private sector provider, or research institution to broad repositories that contain multimodal, multidimensional data from varied data sources covering a broader region. Both central repositories and physical distributed ITS data repositories are supported. Requests for data that are satisfied by access to a single repository in the ITS Data Warehouse service package may be parsed by the local repository and dynamically translated to requests to other repositories that relay the data necessary to satisfy the request.	Existing	ADOT ECD CVO Administration Center

Commercial Vehicle Parking(ADOT TPAS)	This service package provides parking information to commercial vehicle operators both pre-trip and en route. The parking information will be based on information collected from each truck parking area using individual sensors in each space, or in/out sensors for the area. The raw data is processed by state DOT or third party providers and supplied to fleet managers, to mobile devices used by commercial vehicle operators, to DMS on the roadway or directly to in vehicle systems as commercial vehicles approach roadway exits with key facilities such as parking. This service package also provides the ability for the commercial vehicle driver, or fleet manager to request a parking reservation.	Planned	ADOT 511 Website

The parking information will be based on information collected from each truck parking area using individual sensors in each space, or in/out sensors for the area. The raw data is processed by state DOT or third party providers and supplied to fleet managers, to mobile devices used by commercial vehicle operators, to DMS on the roadway or directly to in vehicle systems as commercial vehicles approach roadway exits with key facilities such as parking. This service package also provides the ability for the commercial vehicle driver, or fleet manager to request a parking reservation.	Planned	ADOT Truck Parking Equipment
Commercial Vehicle Parking(ADOT TPAS)	This service package provides parking information to commercial vehicle operators both pre-trip and en route. The parking information will be based on information collected from each truck parking area using individual sensors in each space, or in/out sensors for the area. The raw data is processed by state DOT or third party providers and supplied to fleet managers, to mobile devices used by commercial vehicle operators, to DMS on the roadway or directly to in vehicle systems as commercial vehicles approach roadway exits with key facilities such as parking. This service package also provides the ability for the commercial vehicle driver, or fleet manager to request a parking reservation.	Planned	Caltrans Truck Parking Availability System

This service package also provides the ability for the commercial vehicle driver, or fleet manager to request a parking reservation.	Planned	New Mexico Truck Parking Availability System
Connected Vehicle Performance Monitoring	Connected Vehicle Performance Monitoring service package uses information collected from connected vehicles to support performance monitoring and other uses of historical data including transportation planning, condition monitoring, safety analyses, and research. The information may be probe data information obtained from vehicles in the network to determine network performance measures such as speed and travel times, or it may be information collected from the vehicles and processed by the infrastructure, e.g. environmental data and infrastructure conditions monitoring data.	Planned	ADOT TOC Data Archive
Connected Vehicle Performance Monitoring	Connected Vehicle Performance Monitoring service package uses information collected from connected vehicles to support performance monitoring and other uses of historical data including transportation planning, condition monitoring, safety analyses, and research. The information may be probe data information obtained from vehicles in the network to determine network performance measures such as speed and travel times, or it may be information collected from the vehicles and processed by the infrastructure, e.g. environmental data and infrastructure conditions monitoring data.	Planned	ADOT TOC Data User System

Planned	AZTech RADS Data User System
Connected Vehicle Security and Credentials Management	This service package is used to ensure trusted communications between mobile devices and other mobile devices or roadside devices and protect data they handle from unauthorized access. The service package grants trust credentials to qualified mobile devices and infrastructure devices in the Connected Vehicle Environment so that those devices may be considered trusted by other devices that receive trust credentials from the SCM service package. The service package allows credentials to be requested and revoked and secures the exchange of trust credentials between parties, so that no other party can intercept and use those credentials illegitimately. The service package provides security to the transmissions between connected devices, ensuring authenticity and integrity of the transmissions. Additional security features include privacy protection, authorization and privilege class definition, as well as non-repudiation of origin.	Planned	ADOT Service Monitor System for Connected Vehicle

Counties Weather Info Processing and Distribution	This service package processes and distributes the environmental information collected from the Weather Data Collection service package. This service package uses the environmental data to detect environmental hazards such as icy road conditions, high winds, dense fog, etc. so operational centers and decision support systems can make decision on corrective actions to take. The continuing updates of road condition information and current temperatures can be used to more effectively deploy road maintenance resources, issue general traveler advisories, issue location specific warnings to drivers using the Traffic Information Dissemination service package, and aid operators in scheduling work activity.	Planned	ADOT 511 Website
Counties Weather Info Processing and Distribution	This service package processes and distributes the environmental information collected from the Weather Data Collection service package. County 911 Call-Taking and Dispatch	This service package provides basic public safety call-taking and dispatch services. It includes emergency vehicle equipment, equipment used to receive and route emergency calls, and wireless communications that enable safe and rapid deployment of appropriate resources to an emergency. Coordination between Emergency Management Centers supports emergency notification between agencies. Wide area wireless communications between the Emergency Management Center and an Emergency Vehicle supports dispatch and provision of information to responding personnel.	Existing	County 911 PSAPs
County 911 Call-Taking and Dispatch	This service package provides basic public safety call-taking and dispatch services. It includes emergency vehicle equipment, equipment used to receive and route emergency calls, and wireless communications that enable safe and rapid deployment of appropriate resources to an emergency. Coordination between Emergency Management Centers supports emergency notification between agencies. County Infrastructure-Based Traffic Surveillance	This service package includes traffic detectors, other surveillance equipment, the supporting field equipment, and Center to Field communications to transmit the collected data back to the Traffic Management Center. The derived data can be used locally such as when traffic detectors are connected directly to a signal control system or remotely (e.g., when a CCTV system sends data back to the Traffic Management Center). The data generated by this service package enables traffic managers to monitor traffic and road conditions, identify and verify incidents, detect faults in indicator operations, and collect census data for traffic strategy development and long range planning. The collected data can also be analyzed and made available to users and the Traveler Information Center physical object.	Existing	County Flood Warning System

CV Administrative Processes Arizona Statewide	This service package supports program administration and enrollment and provides for electronic application, processing, fee collection, issuance, and distribution of CVO credential and tax filing. Through this process, carriers, drivers, and vehicles may be enrolled in a variety of programs including electronic clearance and wireless inspection programs which allow commercial vehicles to be screened at mainline speeds. Through this enrollment process, current profile databases are maintained in the Commercial Vehicle Administration subsystem and snapshots of this data are made available to the roadside check facilities. Current program status is maintained and made available to carriers, drivers, and other authorized users of the data. Enrolled carriers are provided the option to review and challenge the collected data.Commercial Vehicle Administration subsystems can share current program status and credential information with other Commercial Vehicle Administration subsystems, so that it is possible for any Commercial Vehicle Administration subsystem to have access to all credentials, credential fees, credentials status and safety status information. In addition, it is possible for one Commercial Vehicle Administration subsystem to collect HAZMAT route restrictions information from other Commercial Vehicle Administration subsystems and then act as a clearinghouse for this route restrictions information for Information Service Providers, Map Update Providers, and Fleet and Freight Management subsystems.	Existing	ADOT 511 Website

CV Administrative Processes Arizona Statewide	This service package supports program administration and enrollment and provides for electronic application, processing, fee collection, issuance, and distribution of CVO credential and tax filing. Through this process, carriers, drivers, and vehicles may be enrolled in a variety of programs including electronic clearance and wireless inspection programs which allow commercial vehicles to be screened at mainline speeds. Through this enrollment process, current profile databases are maintained in the Commercial Vehicle Administration subsystem and snapshots of this data are made available to the roadside check facilities. Current program status is maintained and made available to carriers, drivers, and other authorized users of the data. Enrolled carriers are provided the option to review and challenge the collected data.Commercial Vehicle Administration subsystems can share current program status and credential information with other Commercial Vehicle Administration subsystems, so that it is possible for any Commercial Vehicle Administration subsystem to have access to all credentials, credential fees, credentials status and safety status information. In addition, it is possible for one Commercial Vehicle Administration subsystem to collect HAZMAT route restrictions information from other Commercial Vehicle Administration subsystems and then act as a clearinghouse for this route restrictions information for Information Service Providers, Map Update Providers, and Fleet and Freight Management subsystems.	Existing	DPS Roadside Safety Inspection

CVO Truck Platooning Automated VO	This service package provides full vehicle automation, controlling both the steering and acceleration/deceleration on areas of the highway system that support full automation. Communications between vehicles and between the vehicles and supporting infrastructure equipment supports cooperative check-in to the automated portion of the system and transition to automated mode, coordination of maneuvers between vehicles in automated mode, and checkout from the automated system. This service package is distinguished from the most advanced CACC systems in that full longitudinal and lateral control automation are supported, enabling closely spaced, tightly coupled platoons of vehicles to operate with short fixed gaps, providing greatly enhanced highway capacity and throughput with enhanced efficiency since aerodynamic drag is reduced.	Planned	ADOT CV Roadside Equipment

DEMA ITS Data Warehouse	This service package provides access to transportation data to support transportation planning, condition and performance monitoring, safety analysis, and research for DEMA. Configurations range from focused repositories that house data collected and owned by a single agency, district, private sector provider, or research institution to broad repositories that contain multimodal, multidimensional data from varied data sources covering a broader region. Both central repositories and physical distributed ITS data repositories are supported. Requests for data that are satisfied by access to a single repository in the ITS Data Warehouse service package may be parsed by the local repository and dynamically translated to requests to other repositories that relay the data necessary to satisfy the request.	Existing	Archive Data Users

Planned	DPS Central Communications Center
DPS Freeway Service Patrol	This service package manages both unexpected incidents and planned events so that the impact to the transportation network and traveler safety is minimized. The service package includes incident detection capabilities through roadside surveillance devices (e.g. CCTV) and through regional coordination with other traffic management, maintenance and construction management and emergency management centers as well as rail operations and event promoters. Information from these diverse sources is collected and correlated by this service package to detect and verify incidents and implement an appropriate response. This service package supports traffic operations personnel in developing an appropriate response in coordination with emergency management, maintenance and construction management, and other incident response personnel to confirmed incidents. The response may include traffic control strategy modifications or resource coordination between center subsystems. Incident response also includes presentation of information to affected travelers using the Traffic Information Dissemination service package and dissemination of incident information to travelers through the Broadcast Traveler Information or Interactive Traveler Information service packages. The roadside equipment used to detect and verify incidents also allows the operator to monitor incident status as the response unfolds. The coordination with emergency management might be through a CAD system or through other communication with emergency field personnel. The coordination can also extend to tow trucks and other allied response agencies and field service personnel.	Existing	ADOT ECD Dispatch

DPS Security and Credentials Management	This service package is used to ensure trusted communications between mobile devices and other mobile devices or roadside devices and protect data they handle from unauthorized access. The service package grants trust credentials to qualified mobile devices and infrastructure devices in the Connected Vehicle Environment so that those devices may be considered trusted by other devices that receive trust credentials from the SCM service package. The service package allows credentials to be requested and revoked and secures the exchange of trust credentials between parties, so that no other party can intercept and use those credentials illegitimately. The service package provides security to the transmissions between connected devices, ensuring authenticity and integrity of the transmissions. Additional security features include privacy protection, authorization and privilege class definition, as well as non-repudiation of origin.	Planned	DPS Backhaul Communications System

DUST Dynamic Roadway Warning	This service package includes systems that dynamically warn drivers approaching hazards on a roadway. Such hazards include roadway weather conditions, road surface conditions, traffic conditions including queues, obstacles or animals in the roadway and any other transient event that can be sensed. These dynamic roadway warning systems can alert approaching drivers via warning signs, flashing lights, in-vehicle messages, etc. Such systems can increase the safety of a roadway by reducing the occurrence of incidents. The system can be centrally monitored and controlled by a traffic management center or it can be autonomous. Speed warnings that consider the limitations of a given vehicle for the geometry of the roadway (e.g., rollover risk for tall vehicles) are not included in this service package but are covered by the ATMS19 – Speed Warning and Enforcement service package. Roadway warning systems, especially queue warning systems are an Active Traffic Management (ATM) strategy and are typically used in conjunction with other ATM strategies (such as ATMS22-Variable Speed Limits and ATMS23-Dynamic Lane Management and Shoulder Use).	Existing	ADOT DUST Detection System

The system can be centrally monitored and controlled by a traffic management center or it can be autonomous. Speed warnings that consider the limitations of a given vehicle for the geometry of the roadway (e.g., rollover risk for tall vehicles) are not included in this service package but are covered by the ATMS19 – Speed Warning and Enforcement service package. Roadway warning systems, especially queue warning systems are an Active Traffic Management (ATM) strategy and are typically used in conjunction with other ATM strategies (such as ATMS22-Variable Speed Limits and ATMS23-Dynamic Lane Management and Shoulder Use).	Existing	ADOT Roadside Comm Equipment
DUST Dynamic Roadway Warning	This service package includes systems that dynamically warn drivers approaching hazards on a roadway. Such hazards include roadway weather conditions, road surface conditions, traffic conditions including queues, obstacles or animals in the roadway and any other transient event that can be sensed. These dynamic roadway warning systems can alert approaching drivers via warning signs, flashing lights, in-vehicle messages, etc. Such systems can increase the safety of a roadway by reducing the occurrence of incidents. The system can be centrally monitored and controlled by a traffic management center or it can be autonomous. Speed warnings that consider the limitations of a given vehicle for the geometry of the roadway (e.g., rollover risk for tall vehicles) are not included in this service package but are covered by the ATMS19 – Speed Warning and Enforcement service package. Roadway warning systems, especially queue warning systems are an Active Traffic Management (ATM) strategy and are typically used in conjunction with other ATM strategies (such as ATMS22-Variable Speed Limits and ATMS23-Dynamic Lane Management and Shoulder Use). Existing	ADOT TOC and EMC
Electronic Clearance Pre-Pass Stations	This service package provides for automated clearance at roadside check facilities. The roadside check facility communicates with the Commercial Vehicle Administration subsystem to retrieve infrastructure snapshots of critical carrier, vehicle, and driver data to be used to sort passing vehicles. This allows a good driver/vehicle/carrier to pass roadside facilities at highway speeds using transponders and Field-Vehicle Communications to the roadside. Results of roadside clearance activities will be passed on to the Commercial Vehicle Administration. The roadside check facility may be equipped with Automated Vehicle Identification (AVI), weighing sensors, transponder read/write devices and computer workstations.	Existing	ADOT ECD CVO Administration Center

Emergency Call-Taking and Dispatch	This service package provides basic public safety call-taking and dispatch services. It includes emergency vehicle equipment, equipment used to receive and route emergency calls, and wireless communications that enable safe and rapid deployment of appropriate resources to an emergency. Coordination between Emergency Management Centers supports emergency notification between agencies. Wide area wireless communications between the Emergency Management Center and an Emergency Vehicle supports dispatch and provision of information to responding personnel. This service package also provides information to support dynamic routing of emergency vehicles. Traffic information, road conditions, and weather advisories are provided to enhance emergency vehicle routing. The Emergency Management Center provides routing information based on real-time conditions and has the option to request an ingress/egress route from the Traffic Management Center.	Planned	<None>
Google Transit Traveler Information	This service package provides transit users at transit stops and on-board transit vehicles with ready access to transit information. The information services include transit stop annunciation, imminent arrival signs, and real-time transit schedule displays that are of general interest to transit users. Systems that provide custom transit trip itineraries and other tailored transit information services are also represented by this service package.	Planned	Personal Information Devices for Travelers

Greater Yuma Area Dial-A-Ride Transit Operations	This service package performs automated dispatch and system monitoring for demand responsive transit services or dial-a-ride. Riders of this service must be persons with disabilities. This service performs scheduling activities as well as operator assignment. In addition, this service package performs similar functions to support dynamic features of flexible-route transit services. This package monitors the current status of the transit fleet and supports allocation of these fleet resources to service incoming requests for transit service while also considering traffic conditions. The Transit Management Subsystem provides the necessary data processing and information display to assist the transit operator in making optimal use of the transit fleet. This service includes the capability for a traveler request for personalized transit services to be made through the Information Service Provider (ISP) Subsystem. The ISP may either be operated by a transit management center or be independently owned and operated by a separate service provider. In the first scenario, the traveler makes a direct request to a specific paratransit service. In the second scenario, a third party service provider determines that the paratransit service is a viable means of satisfying a traveler request and makes a reservation for the traveler.	Planned	Public Private Traveler Information

The service package also supports the day to day management of the transit fleet inventory, including the assignment of specific transit vehicles to blocks.	Planned	Independent School District Buses
Independent School District Transit Security	This service package provides for the physical security of transit passengers and transit vehicle operators. On-board equipment is deployed to perform surveillance and sensor monitoring in order to warn of potentially hazardous situations. The surveillance equipment includes video (e.g., CCTV cameras), audio systems and/or event recorder systems. The sensor equipment includes threat sensors (e.g., chemical agent, toxic industrial chemical, biological, explosives, and radiological sensors) and object detection sensors (e.g., metal detectors). Transit user or transit vehicle operator activated alarms are provided on-board. Public areas (e.g., transit stops, park and ride lots, stations) are also monitored with similar surveillance and sensor equipment and provided with transit user activated alarms. In addition this service package provides surveillance and sensor monitoring of non-public areas of transit facilities (e.g., transit yards) and transit infrastructure such as bridges, tunnels, and transit railways or bus rapid transit (BRT) guideways. The surveillance equipment includes video and/or audio systems. The sensor equipment includes threat sensors and object detection sensors as described above as well as, intrusion or motion detection sensors and infrastructure integrity monitoring (e.g., rail track continuity checking or bridge structural integrity monitoring).The surveillance and sensor information is transmitted to the Emergency Management Subsystem, as are transit user activated alarms in public secure areas. On-board alarms, activated by transit users or transit vehicle operators are transmitted to both the Emergency Management Subsystem and the Transit Management Subsystem, indicating two possible approaches to implementing this service package.In addition the service package supports remote transit vehicle disabling by the Transit Management Subsystem and transit vehicle operator authentication.	Planned	DPS Central Communications Center

Planned	Independent School District Buses
Independent School District Transit Vehicle Tracking	This service package monitors current transit vehicle location using an Automated Vehicle Location System. The location data may be used to determine real time schedule adherence and update the transit system's schedule in real-time. Vehicle position may be determined either by the vehicle (e.g., through GPS) and relayed to the infrastructure or may be determined directly by the communications infrastructure. A two-way wireless communication link with the Transit Management Subsystem is used for relaying vehicle position and control measures. Fixed route transit systems may also employ beacons along the route to enable position determination and facilitate communications with each vehicle at fixed intervals. The Transit Management Subsystem processes this information, updates the transit schedule and makes real-time schedule information available to the Information Service Provider.	Existing	Independent School District Bus Dispatch

Service Package Name	Service Package Description	Service Package Status	Included Elements
Independent School District Transit Vehicle Tracking	This service package monitors current transit vehicle location using an Automated Vehicle Location System. The location data may be used to determine real time schedule adherence and update the transit system's schedule in real-time. Vehicle position may be determined either by the vehicle (e.g., through GPS) and relayed to the infrastructure or may be determined directly by the communications infrastructure. A two-way wireless communication link with the Transit Management Subsystem is used for relaying vehicle position and control measures. Fixed route transit systems may also employ beacons along the route to enable position determination and facilitate communications with each vehicle at fixed intervals. The Transit Management Subsystem processes this information, updates the transit schedule and makes real-time schedule information available to the Information Service Provider.	Existing	Independent School District Buses

The Transit Management Subsystem processes this information, updates the transit schedule and makes real-time schedule information available to the Information Service Provider.	Existing	Vehicle GPS and Time Data
International Border Pre-Processing POE Inspection Administration	This service package provides for automated clearance at international border crossings. It augments the Electronic Clearance service package by allowing interface with border administration and border inspection related functions. This service package processes the entry documentation for vehicle, cargo, and driver, checks compliance with import/export and immigration regulations, handles duty fee processing, and reports the results of the crossing event to manage release of commercial vehicle, cargo, and driver across an international border. It interfaces with administrative systems used by customs and border protection, immigration, carriers, and service providers (e.g., brokers) and inspection systems at international border crossings to generate, process, and store entry documentation.	Existing	ADOT MVD Commercial Vehicle Administration

Existing	Transit Providers Vehicles (Public and Private)
Local Public Private Transit and Dial-a-Ride Security	This service package provides for the physical security of transit passengers and transit vehicle operators. On-board equipment performs surveillance and sensor monitoring in order to identify potentially hazardous situations. The surveillance equipment includes video (e.g., CCTV cameras), audio systems and/or event recorder systems. The sensor equipment includes threat sensors (e.g., chemical agent, toxic industrial chemical, biological, explosives, and radiological sensors) and object detection sensors (e.g., metal detectors). Transit user or transit vehicle operator activated alarms are provided on-board. Public areas (e.g., transit stops, park and ride lots, stations) are also monitored with similar surveillance and sensor equipment and provided with transit user activated alarms. In addition this service package provides surveillance and sensor monitoring of non-public areas of transit facilities (e.g., transit yards) and transit infrastructure such as bridges, tunnels, and transit railways or bus rapid transit (BRT) guideways. The surveillance equipment includes video and/or audio systems. The sensor equipment includes threat sensors and object detection sensors as described above as well as, intrusion or motion detection sensors and infrastructure integrity monitoring (e.g., rail track continuity checking or bridge structural integrity monitoring).Most of the surveillance and sensor data that is collected by this service package may be monitored by either the Emergency Management Center or the Transit Management Center, providing two possible approaches to implementing this service package. This service package also supports remote transit vehicle disabling and transit vehicle operator authentication by the Transit Management Center.	Planned	DPS Central Communications Center

The collected data can be used to calculate reliable ridership figures and measure passenger load information at particular stops.	Planned	Transit Providers Vehicles (Public and Private)
Mohave County Curve Speed Warning	This service package allows connected vehicles to receive information that it is approaching a curve along with the recommended speed for the curve. This capability allows the vehicle to provide a warning to the driver regarding the curve and its recommended speed. In addition, the vehicle can perform additional warning actions if the actual speed through the curve exceeds the recommended speed.	Planned	Mohave County V2I Enabled Rural Highway Traffic Control Signs
Mohave County Stop Sign Gap Assist	This service package is intended to improve safety at non-signalized intersections where only the minor road has posted stop signs. It includes both onboard (for connected vehicles) and roadside signage warning systems (for non-equipped vehicles). The service package helps drivers on a minor road stopped at an intersection understand the state of activities associated with that intersection by providing a warning of unsafe gaps on the major road. The SSGA service package collects all available sensor information (major road, minor road, and median sensors), detects the presence of vulnerable road users and other vehicles, and computes the dynamic state of the intersection in order to issue appropriate warnings and alerts.	Planned	Mohave County V2I Enabled Rural Highway Traffic Control Signs

Service Package Name	Service Package Description	Service Package Status	Included Elements
MPO ITS Data Warehouse	This service package provides access to transportation data to support transportation planning, condition and performance monitoring, safety analysis, and research for Metropolitan Planning Organizations throughout Arizona. Configurations range from focused repositories that house data collected and owned by a single agency, district, private sector provider, or research institution to broad repositories that contain multimodal, multidimensional data from varied data sources covering a broader region. Both central repositories and physical distributed ITS data repositories are supported. Requests for data that are satisfied by access to a single repository in the ITS Data Warehouse service package may be parsed by the local repository and dynamically translated to requests to other repositories that relay the data necessary to satisfy the request.	Existing	Archive Data Users

NAIPTA Fixed Route Transit	This service package performs automated dispatch and system monitoring for fixed-route and flexible-route transit services. This service performs scheduling activities including the creation of schedules, blocks and runs, as well as operator assignment. This service determines the transit vehicle trip performance against the schedule using AVL data and provides information displays at the Transit Management Subsystem. Static and real time transit data is exchanged with Information Service Providers where it is integrated with that from other transportation modes (e.g. rail, ferry, air) to provide the public with integrated and personalized dynamic schedules.	Planned	NAIPTA (dba Mountain Line) Transit Buses

NAIPTA Transit Security	This service package provides for the physical security of transit passengers and transit vehicle operators. On-board equipment performs surveillance and sensor monitoring in order to identify potentially hazardous situations. The surveillance equipment includes video (e.g., CCTV cameras), audio systems and/or event recorder systems. The sensor equipment includes threat sensors (e.g., chemical agent, toxic industrial chemical, biological, explosives, and radiological sensors) and object detection sensors (e.g., metal detectors). Transit user or transit vehicle operator activated alarms are provided on-board. Public areas (e.g., transit stops, park and ride lots, stations) are also monitored with similar surveillance and sensor equipment and provided with transit user activated alarms. In addition this service package provides surveillance and sensor monitoring of non-public areas of transit facilities (e.g., transit yards) and transit infrastructure such as bridges, tunnels, and transit railways or bus rapid transit (BRT) guideways. The surveillance equipment includes video and/or audio systems. The sensor equipment includes threat sensors and object detection sensors as described above as well as, intrusion or motion detection sensors and infrastructure integrity monitoring (e.g., rail track continuity checking or bridge structural integrity monitoring).Most of the surveillance and sensor data that is collected by this service package may be monitored by either the Emergency Management Center or the Transit Management Center, providing two possible approaches to implementing this service package. This service package also supports remote transit vehicle disabling and transit vehicle operator authentication by the Transit Management Center.	Existing	County Transit Kiosks

NAIPTA Transit Vehicle Tracking	This service package monitors current transit vehicle location for NAIPA using an Automated Vehicle Location System. The location data may be used to determine real time schedule adherence and update the transit system's schedule in real-time. Vehicle position may be determined either by the vehicle (e.g., through GPS) and relayed to the infrastructure or may be determined directly by the communications infrastructure. A two-way wireless communication link with the Transit Management Subsystem is used for relaying vehicle position and control measures. Fixed route transit systems may also employ beacons along the route to enable position determination and facilitate communications with each vehicle at fixed intervals. The Transit Management Subsystem processes this information, updates the transit schedule and makes real-time schedule information available to the Information Service Provider.	Existing	NAIPTA (dba Mountain Line) Paratransit

NIAPTA Paratransit Demand Response	This service package performs automated dispatch and system monitoring for demand responsive transit services. This service performs scheduling activities as well as operator assignment. In addition, this service package performs similar functions to support dynamic features of flexible-route transit services. This package monitors the current status of the transit fleet and supports allocation of these fleet resources to service incoming requests for transit service while also considering traffic conditions. The Transit Management Subsystem provides the necessary data processing and information display to assist the transit operator in making optimal use of the transit fleet. This service includes the capability for a traveler request for personalized transit services to be made through the Information Service Provider (ISP) Subsystem. The ISP may either be operated by a transit management center or be independently owned and operated by a separate service provider. In the first scenario, the traveler makes a direct request to a specific paratransit service. In the second scenario, a third party service provider determines that the paratransit service is a viable means of satisfying a traveler request and makes a reservation for the traveler.	Planned	NAIPTA (dba Mountain Line) Paratransit

The location data may be used to determine real time schedule adherence and update the transit system's schedule in real-time.	Existing	Public Private Traveler Information
Private Motorists In-Vehicle Signage	This service package augments regulatory, warning, and informational signs and signals by providing information directly to drivers through in-vehicle devices. The information provided would include static sign information (e.g., stop, curve warning, guide signs, service signs, and directional signs) and dynamic information (e.g., current signal states including highway intersection and highway-rail intersection status and local conditions warnings identified by local environmental sensors). This service package also includes the capability for maintenance and construction, emergency, and transit vehicles to transmit sign information to vehicles in the vicinity so that in vehicle signing can be used without fixed infrastructure in areas such as work zones, around incidents, and at bus stops.	Planned	ADOT Mainline Detection
Private Motorists In-Vehicle Signage	This service package augments regulatory, warning, and informational signs and signals by providing information directly to drivers through in-vehicle devices. The information provided would include static sign information (e.g., stop, curve warning, guide signs, service signs, and directional signs) and dynamic information (e.g., current signal states including highway intersection and highway-rail intersection status and local conditions warnings identified by local environmental sensors). This service package also includes the capability for maintenance and construction, emergency, and transit vehicles to transmit sign information to vehicles in the vicinity so that in vehicle signing can be used without fixed infrastructure in areas such as work zones, around incidents, and at bus stops.	Planned	ADOT Maintenance Work Zone Field Equipment
Private Motorists In-Vehicle Signage	This service package augments regulatory, warning, and informational signs and signals by providing information directly to drivers through in-vehicle devices. The information provided would include static sign information (e.g., stop, curve warning, guide signs, service signs, and directional signs) and dynamic information (e.g., current signal states including highway intersection and highway-rail intersection status and local conditions warnings identified by local environmental sensors). This service package also includes the capability for maintenance and construction, emergency, and transit vehicles to transmit sign information to vehicles in the vicinity so that in vehicle signing can be used without fixed infrastructure in areas such as work zones, around incidents, and at bus stops.	Planned	ADOT Roadside Comm Equipment

Service Package Name	Service Package Description	Service Package Status	Included Elements

Planned	Local Dial-A-Ride Transit Vehicles
Private Railroad Operations	--Instance of TM15-- This service package provides an additional level of strategic coordination between freight rail operations and other transportation centers. Rail operations provides train schedules, maintenance schedules, and any other forecast events that will result in highway-rail intersection (HRI) closures. This information is used to develop forecast HRI closure times and durations that may be used in advanced traffic control strategies or to enhance the quality of traveler information.	Existing	DEMA CRT - HazMat Response Team

Existing	Wide Area Alerting Systems
Public and Private Transit Vehicle Tracking	This service package monitors current transit vehicle location using an Automated Vehicle Location System. The location data may be used to determine real time schedule adherence and update the transit system's schedule in real-time.	Planned	Public Private Traveler Information
Public and Private Transit Vehicle Tracking	This service package monitors current transit vehicle location using an Automated Vehicle Location System. The location data may be used to determine real time schedule adherence and update the transit system's schedule in real-time.	Planned	Transit Providers Dispatch (Public and Private)
Public and Private Transit Vehicle Tracking	This service package monitors current transit vehicle location using an Automated Vehicle Location System. The location data may be used to determine real time schedule adherence and update the transit system's schedule in real-time.	Planned	Transit Providers Vehicles (Public and Private)
Roadside CVO Safety 1 of 2	This service package provides for automated roadside safety monitoring and reporting. It automates commercial vehicle safety inspections at the roadside check locations. The capabilities for performing the safety inspection are shared between this service package and the On-board CVO and Freight Safety & Security (CVO08) service package which enables a variety of implementation options. The basic option, directly supported by this service package, facilitates safety inspection of vehicles that have been pulled off the highway, perhaps as a result of the automated screening process provided by the Electronic Clearance (CVO03) service package. In this scenario, only basic identification data and status information is read from the electronic tag on the commercial vehicle. The identification data from the tag enables access to additional safety data maintained in the infrastructure which is used to support the safety inspection, and may also inform the pull-in decision if system timing requirements can be met. More advanced implementations, supported by the On-board CVO and Freight Safety & Security (CVO08) service package, utilize additional on-board vehicle safety monitoring and reporting capabilities in the commercial vehicle to augment the roadside safety check.	Existing	ADOT MVD Commercial Vehicle Administration

Planned	DPS Central Communications Center
Roadside Motor Assist (RMA) Service Patrols	This service package supports roadway service patrol vehicles that monitor roads that aid motorists, offering rapid response to minor incidents (flat tire, accidents, out of gas) to minimize disruption to the traffic stream. If problems are detected, the roadway service patrol vehicles will provide assistance to the motorist (e.g., push a vehicle to the shoulder or median). The service package monitors service patrol vehicle locations and supports vehicle dispatch to identified incident locations. Incident information collected by the service patrol is shared with traffic, maintenance and construction, and traveler information systems.	Existing	DPS Central Communications Center

Standard Railroad Grade Crossing	This service package manages highway traffic at highway-rail intersections (HRIs) where operational requirements do not dictate more advanced features (e.g., where rail operational speeds are less than 80 miles per hour). Both passive (e.g., the crossbuck sign) and active warning systems (e.g., flashing lights and gates) are supported. (Note that passive systems exercise only the single interface between the ITS Roadway Equipment and the Driver in the physical view.) These traditional HRI warning systems may also be augmented with other standard traffic management devices. The warning systems are activated on notification of an approaching train by interfaced wayside equipment. The equipment at the HRI may also be interconnected with adjacent signalized intersections so that local control can be adapted to highway-rail intersection activities. Health monitoring of the HRI equipment and interfaces is performed; detected abnormalities are reported to both highway and railroad officials through wayside interfaces and interfaces to the Traffic Management Center.	Existing	ADOT Roadside Comm Equipment

Traffic Information Dissemination	This service package provides driver information using roadway equipment such as dynamic message signs or highway advisory radio. A wide range of information can be disseminated including traffic and road conditions, closure and detour information, travel restrictions, incident information, and emergency alerts and driver advisories. This package provides information to drivers at specific equipped locations on the road network. Careful placement of the roadway equipment provides the information at points in the network where the drivers have recourse and can tailor their routes to account for the new information. This package also covers the equipment and interfaces that provide traffic information from a traffic management center to the media (for instance via a direct tie-in between a traffic management center and radio or television station computer systems), Transit Management, Emergency Management, and Transportation Information Centers. A link to the Maintenance and Construction Management Center allows real time information on road/bridge closures and restrictions due to maintenance and construction activities to be disseminated.	Planned	ADOT 511 Website

This package provides information to drivers at specific equipped locations on the road network. Careful placement of the roadway equipment provides the information at points in the network where the drivers have recourse and can tailor their routes to account for the new information. This package also covers the equipment and interfaces that provide traffic information from a traffic management center to the media (for instance via a direct tie-in between a traffic management center and radio or television station computer systems), Transit Management, Emergency Management, and Transportation Information Centers. A link to the Maintenance and Construction Management Center allows real time information on road/bridge closures and restrictions due to maintenance and construction activities to be disseminated.	Planned	BIA Western Regional Website

Service Package Name	Service Package Description	Service Package Status	Included Elements
Traffic Information Dissemination	This service package provides driver information using roadway equipment such as dynamic message signs or highway advisory radio. A wide range of information can be disseminated including traffic and road conditions, closure and detour information, travel restrictions, incident information, and emergency alerts and driver advisories. This package provides information to drivers at specific equipped locations on the road network. Careful placement of the roadway equipment provides the information at points in the network where the drivers have recourse and can tailor their routes to account for the new information. This package also covers the equipment and interfaces that provide traffic information from a traffic management center to the media (for instance via a direct tie-in between a traffic management center and radio or television station computer systems), Transit Management, Emergency Management, and Transportation Information Centers. A link to the Maintenance and Construction Management Center allows real time information on road/bridge closures and restrictions due to maintenance and construction activities to be disseminated.	Planned	DPS Central Communications Center

Planned	Public Private Traveler Information
Transit Data Warehouse	This service package provides access to transportation data to support transportation planning, condition and performance monitoring, safety analysis, and research. Configurations range from focused repositories that house data collected and owned by a single agency, district, private sector provider, or research institution to broad repositories that contain multimodal, multidimensional data from varied data sources covering a broader region. Both central repositories and physical distributed ITS data repositories are supported. Requests for data that are satisfied by access to a single repository in the ITS Data Warehouse service package may be parsed by the local repository and dynamically translated to requests to other repositories that relay the data necessary to satisfy the request.	Existing	Archive Data Users

Service Package Name	Service Package Description	Service Package Status	Included Elements
Tribal Infrastructure-Based Traffic Surveillance	This service package includes traffic detectors, other surveillance equipment, the supporting field equipment, and Center to Field communications to transmit the collected data back to the Traffic Management Center. The derived data can be used locally such as when traffic detectors are connected directly to a signal control system or remotely (e.g., when a CCTV system sends data back to the Traffic Management Center). The data generated by this service package enables traffic managers to monitor traffic and road conditions, identify and verify incidents, detect faults in indicator operations, and collect census data for traffic strategy development and long range planning. The collected data can also be analyzed and made available to users and the Traveler Information Center physical object.	Existing	ADOT 511 Website
Tribal Infrastructure-Based Traffic Surveillance	This service package includes traffic detectors, other surveillance equipment, the supporting field equipment, and Center to Field communications to transmit the collected data back to the Traffic Management Center. Tribal Paratransit Dial-a-Ride Services	The Dynamic Transit Operations service package allows travelers to request trips and obtain itineraries using a personal device such as a smart phone, tablet, or personal computer. The trips and itineraries cover multiple transportation services (public transportation modes, private transportation services, shared-ride, walking and biking). This service package builds on existing technology systems such as computer-aided dispatch/ automated vehicle location (CAD/AVL) systems and automated scheduling software, providing a coordination function within and between transit providers that would dynamically schedule and dispatch or modify the route of an in-service vehicle by matching compatible trips together. TI06 covers other shared use transportation options.	Planned	Travelers

Service Package Name	Service Package Description	Service Package Status	Included Elements
Tribal Rail Grade Crossing	This service package manages highway traffic at highway-rail intersections (HRIs) where operational requirements do not dictate more advanced features (e.g., where rail operational speeds are less than 80 miles per hour). Both passive (e.g., the crossbuck sign) and active warning systems (e.g., flashing lights and gates) are supported. (Note that passive systems exercise only the single interface between the roadway subsystem and the driver in the architecture definition.) These traditional HRI warning systems may also be augmented with other standard traffic management devices. The warning systems are activated on notification by interfaced wayside equipment of an approaching train. The equipment at the HRI may also be interconnected with adjacent signalized intersections so that local control can be adapted to highway-rail intersection activities. Health monitoring of the HRI equipment and interfaces is performed; detected abnormalities are reported to both highway and railroad officials through wayside interfaces and interfaces to the traffic management subsystem.	Existing	Rail Grade Wayside Warning Systems
Tribal Rail Grade Crossing	This service package manages highway traffic at highway-rail intersections (HRIs) where operational requirements do not dictate more advanced features (e.g., where rail operational speeds are less than 80 miles per hour). The equipment at the HRI may also be interconnected with adjacent signalized intersections so that local control can be adapted to highway-rail intersection activities. Health monitoring of the HRI equipment and interfaces is performed; detected abnormalities are reported to both highway and railroad officials through wayside interfaces and interfaces to the traffic management subsystem.	Existing	Tribal ITS Field Equipment
Tribal Speed Warning and Enforcement	This service package monitors vehicle speeds and supports warning drivers when their speed is excessive. Also the service includes notifications to an enforcement agency to enforce the speed limit of the roadway. Speed monitoring can be made via spot speed or average speed measurements. Roadside equipment can display the speed of passing vehicles and/or suggest a safe driving speed. Environmental conditions and vehicle characteristics may be monitored and factored into the safe speed advisories that are provided to the motorist. For example, warnings can be generated recognizing the limitations of a given vehicle for the geometry of the roadway such as rollover risk for tall vehicles. This service focuses on monitoring of vehicle speeds and enforcement of the speed limit while the variable speed limits service (covered in TM20-Variable Speed Limits service package) focuses on varying the posted speed limits to create more uniform speeds along a roadway, to promote safer driving during adverse conditions (such as fog) and/or to reduce air pollution.	Planned	Tribal ITS Field Equipment

Service Package Name	Service Package Description	Service Package Status	Included Elements

Planned	Tribal TMC-TOC-TIC
Tribal Traffic Information Dissemination	This service package provides driver information using roadway equipment such as dynamic message signs or highway advisory radio. A wide range of information can be disseminated including traffic and road conditions, closure and detour information, travel restrictions, incident information, and emergency alerts and driver advisories. This package provides information to drivers at specific equipped locations on the road network. Careful placement of the roadway equipment provides the information at points in the network where the drivers have recourse and can tailor their routes to account for the new information. This package also covers the equipment and interfaces that provide traffic information from a traffic management center to the media (for instance via a direct tie-in between a traffic management center and radio or television station computer systems), Transit Management, Emergency Management, and Transportation Information Centers. A link to the Maintenance and Construction Management Center allows real time information on road/bridge closures and restrictions due to maintenance and construction activities to be disseminated.	Planned	ADOT 511 Website
Tribal Traffic Information Dissemination	This service package provides driver information using roadway equipment such as dynamic message signs or highway advisory radio. A wide range of information can be disseminated including traffic and road conditions, closure and detour information, travel restrictions, incident information, and emergency alerts and driver advisories. This package provides information to drivers at specific equipped locations on the road network. Tribal Traffic Signal Control	This service package provides the central control and monitoring equipment, communication links, and the signal control equipment that support traffic control at signalized intersections. A range of traffic signal control systems are represented by this service package ranging from fixed-schedule control systems to fully traffic responsive systems that dynamically adjust control plans and strategies based on current traffic conditions and priority requests. This service package is generally an intra-jurisdictional package. Systems that achieve coordination across jurisdictions by using a common time base or other strategies that do not require real time coordination would also be represented by this package. Coordination of traffic signal systems using real-time communications is covered in the ATMS07-Regional Traffic Management service package. This service package is consistent with typical traffic signal control systems.	Planned	Tribal ITS Field Equipment

Tribal Transit Fleet Management	This service package supports automatic transit maintenance scheduling and monitoring. On-board condition sensors monitor system status and transmit critical status information to the Transit Management Center. The Transit Management Center processes this data and schedules preventative and corrective maintenance. The service package also supports the day to day management of the transit fleet inventory, including the assignment of specific transit vehicles to blocks.	Planned	Tribal Transit Centers

Tribal Transit Security	This service package provides for the physical security of transit passengers and transit vehicle operators. On-board equipment performs surveillance and sensor monitoring in order to identify potentially hazardous situations. The surveillance equipment includes video (e.g., CCTV cameras), audio systems and/or event recorder systems. The sensor equipment includes threat sensors (e.g., chemical agent, toxic industrial chemical, biological, explosives, and radiological sensors) and object detection sensors (e.g., metal detectors). Transit user or transit vehicle operator activated alarms are provided on-board. Public areas (e.g., transit stops, park and ride lots, stations) are also monitored with similar surveillance and sensor equipment and provided with transit user activated alarms. In addition this service package provides surveillance and sensor monitoring of non-public areas of transit facilities (e.g., transit yards) and transit infrastructure such as bridges, tunnels, and transit railways or bus rapid transit (BRT) guideways. The surveillance equipment includes video and/or audio systems. The sensor equipment includes threat sensors and object detection sensors as described above as well as, intrusion or motion detection sensors and infrastructure integrity monitoring (e.g., rail track continuity checking or bridge structural integrity monitoring).Most of the surveillance and sensor data that is collected by this service package may be monitored by either the Emergency Management Center or the Transit Management Center, providing two possible approaches to implementing this service package. This service package also supports remote transit vehicle disabling and transit vehicle operator authentication by the Transit Management Center.	Planned	Tribal Public Safety Dispatch

Tribal Work Zone Management	This service package manages work zones, controlling traffic in areas of the roadway where maintenance, construction, and utility work activities are underway. Traffic conditions are monitored using CCTV cameras and controlled using dynamic message signs (DMS), Highway Advisory Radio (HAR), gates and barriers. Work zone information is coordinated with other groups (e.g., TIC, traffic management, other maintenance and construction centers). Work zone speeds and delays are provided to the motorist prior to the work zones. This service package provides control of field equipment in all maintenance and construction areas, including fixed, portable, and truck-mounted devices supporting both stationary and mobile work zones.	Planned	Tribal ITS Field Equipment

Service Package Name	Service Package Description	Service Package Status	Included Elements
Wide Area Alert for EOCs statewide	This service package uses ITS driver and traveler information systems to alert the public in emergency situations such as child abductions, severe weather events, civil emergencies, and other situations that pose a threat to life and property. The alert includes information and instructions for transportation system operators and the traveling public, improving public safety and enlisting the public's help in some scenarios. The ITS technologies will supplement and support other emergency and homeland security alert systems such as the Emergency Alert System (EAS) or the IPAWS system. When an emergency situation is reported and verified and the terms and conditions for system activation are satisfied, a designated agency broadcasts emergency information to traffic agencies, transit agencies, information service providers, toll operators, and others that operate ITS systems. The ITS systems, in turn, provide the alert information to transportation system operators and the traveling public using ITS technologies such as dynamic message signs, highway advisory radios, in-vehicle displays, transit displays, 511 traveler information systems, and traveler information web sites.	Existing	ADOT 511 IVR

Wide Area Alert for EOCs statewide	This service package uses ITS driver and traveler information systems to alert the public in emergency situations such as child abductions, severe weather events, civil emergencies, and other situations that pose a threat to life and property. The alert includes information and instructions for transportation system operators and the traveling public, improving public safety and enlisting the public's help in some scenarios. The ITS technologies will supplement and support other emergency and homeland security alert systems such as the Emergency Alert System (EAS) or the IPAWS system. When an emergency situation is reported and verified and the terms and conditions for system activation are satisfied, a designated agency broadcasts emergency information to traffic agencies, transit agencies, information service providers, toll operators, and others that operate ITS systems. The ITS systems, in turn, provide the alert information to transportation system operators and the traveling public using ITS technologies such as dynamic message signs, highway advisory radios, in-vehicle displays, transit displays, 511 traveler information systems, and traveler information web sites.	Existing	ADOT TOC Traffic Information Center

YCAT Fixed-Route Transit	This service package performs automated dispatch and system monitoring for fixed-route and flexible-route transit services. This service performs scheduling activities including the creation of schedules, blocks and runs, as well as operator assignment. This service determines the transit vehicle trip performance against the schedule using AVL data and provides information displays at the Transit Management Subsystem. Static and real time transit data is exchanged with Information Service Providers where it is integrated with that from other transportation modes (e.g. rail, ferry, air) to provide the public with integrated and personalized dynamic schedules.	Planned	Public Private Traveler Information

YCAT Transit Fare Collection	This service package manages transit fare collection on-board transit vehicles and at transit stops using electronic means. It allows transit users to use a traveler card or other electronic payment device. Readers located either in the infrastructure or on-board the transit vehicles enable electronic fare payment. Data is processed, stored, and displayed on the transit vehicle and communicated as needed to the Transit Management Subsystem. Two other service packages, ATMS10: Electronic Toll Collection and ATMS16: Parking Facility Management, also provide electronic payment services. These three service packages in combination provide an integrated electronic payment system for transportation services.	Existing	Financial Institution

Service Package Name	Service Package Description	Service Package Status	Included Elements
YCAT Transit Security	This service package provides for the physical security of transit passengers and transit vehicle operators. On-board equipment is deployed to perform surveillance and sensor monitoring in order to warn of potentially hazardous situations. The surveillance equipment includes video (e.g., CCTV cameras), audio systems and/or event recorder systems. The sensor equipment includes threat sensors (e.g., chemical agent, toxic industrial chemical, biological, explosives, and radiological sensors) and object detection sensors (e.g., metal detectors). Transit user or transit vehicle operator activated alarms are provided on-board. Public areas (e.g., transit stops, park and ride lots, stations) are also monitored with similar surveillance and sensor equipment and provided with transit user activated alarms. In addition this service package provides surveillance and sensor monitoring of non-public areas of transit facilities (e.g., transit yards) and transit infrastructure such as bridges, tunnels, and transit railways or bus rapid transit (BRT) guideways. The surveillance equipment includes video and/or audio systems. The sensor equipment includes threat sensors and object detection sensors as described above as well as, intrusion or motion detection sensors and infrastructure integrity monitoring (e.g., rail track continuity checking or bridge structural integrity monitoring).The surveillance and sensor information is transmitted to the Emergency Management Subsystem, as are transit user activated alarms in public secure areas. On-board alarms, activated by transit users or transit vehicle operators are transmitted to both the Emergency Management Subsystem and the Transit Management Subsystem, indicating two possible approaches to implementing this service package.In addition the service package supports remote transit vehicle disabling by the Transit Management Subsystem and transit vehicle operator authentication.	Existing	DPS Central Communications Center

YCAT Transit Vehicle Tracking	This service package monitors current transit vehicle location of Yuma Transit Vehicles using an Automated Vehicle Location System. The location data may be used to determine real time schedule adherence and update the transit system's schedule in real-time. Vehicle position may be determined either by the vehicle (e.g., through GPS) and relayed to the infrastructure or may be determined directly by the communications infrastructure. A two-way wireless communication link with the Transit Management Subsystem is used for relaying vehicle position and control measures. Fixed route transit systems may also employ beacons along the route to enable position determination and facilitate communications with each vehicle at fixed intervals. The Transit Management Subsystem processes this information, updates the transit schedule and makes real-time schedule information available to the Information Service Provider.	Existing	Vehicle GPS and Time Data

Yuma Transit Signal Priority	This service package determines the need for transit priority on routes and at certain intersections and requests transit vehicle priority at these locations. The signal priority may result from limited local coordination between the transit vehicle and the individual intersection for signal priority or may result from coordination between transit management and traffic management centers. Coordination between traffic and transit management is intended to improve on-time performance of the transit system to the extent that this can be accommodated without degrading overall performance of the traffic network.	Planned	YCAT Buses

Roles and Responsibilities (RR) Area Name	Roles and Responsibilities (RR) Area Description	Stakeholder	RR Status
Commercial Vehicle Operations for Arizona	Arizona Commercial Vehicle Operations (CVO) statewide operate at one or more fixed locations within Arizona. The state CVO performs administrative functions supporting credentials, tax, and safety regulations. It issues credentials, collects fees and taxes, and supports enforcement of credential requirements. The Statewide CVO communicates with the Fleet Management Subsystems associated with the motor carriers to process credentials applications and collect fuel taxes, weight/distance taxes, and other taxes and fees associated with commercial vehicle operations. CVO also receives applications for, and issues special Oversize/Overweight and HAZMAT permits in coordination with other cognizant authorities. The subsystem coordinates with other Commercial Vehicle Administration Subsystems (in other states/regions) to support nationwide access to credentials and safety information for administration and enforcement functions. This subsystem supports communications with Commercial Vehicle Check Subsystems operating at the roadside to enable credential checking and safety information collection. The collected safety information is processed, stored, and made available to qualified stakeholders to identify carriers and drivers that operate unsafely.	ADOT	Existing

Connected Vehicle Support for Arizona	Provides monitoring, management and control services necessary to other applications and/or devices operating within the Connected Vehicle Environment. This Role/Responsibility area relates to maintaining and monitoring the performance and configuration of the connected vehicle system. This includes tracking and management of the infrastructure configuration as well as detection, isolation, and correction of infrastructure service problems. It also includes monitoring of performance of the infrastructure and mobile equipment, which includes RSEs, OBEs, the back office applications, as well as the communication links that connect the system. Identifies the external systems and interfaces that provide accurate location and time to intelligent transportation system devices and systems.Ensure trusted communications between mobile devices and other mobile devices or roadside devices and protect data they handle from unauthorized access. The service package grants trust credentials to qualified mobile devices and infrastructure devices in the Connected Vehicle Environment so that those devices may be considered trusted by other devices that receive trust credentials from the SCM service package. The service package allows credentials to be requested and revoked and secures the exchange of trust credentials between parties, so that no other party can intercept and use those credentials illegitimately. The service package provides security to the transmissions between connected devices, ensuring authenticity and integrity of the transmissions. Additional security features include privacy protection, authorization and privilege class definition, as well as non-repudiation of origin.	ADOT	Existing
