Re: Asbestos and Lead-based Paint Sampling and Analysis
 NH-NHFP-040-A(212)S
 040 MO 048 H7993 01C
 I-40/US 93 West Kingman System Traffic Interchange

Dear Mr. Green:

Archaeological Consulting Services, Ltd. (ACS) is providing this letter report to document the results of a National Emission Standards for Hazardous Air Pollutants (NESHAP) survey of suspect asbestos-containing material (ACM), and a lead-based paint (LBP) survey for the above-referenced project. Work for this project was conducted under Jacobs Engineering, Inc.'s (Jacobs') 2019-002 contract with the Arizona Department of Transportation (ADOT).

Introduction

ADOT is initiating an engineering and environmental study to identify and evaluate alternatives for a proposed traffic interchange (TI) to connect Interstate 40 (I-40) and US Highway 93 (US 93). The project limits on I-40 extend from milepost (MP) 48.32 to MP 51.75 (Stockton Hill Road), and along US 93 from MP 69.60 to approximately MP 71.00 (US 93/I-40 system interchange).

ACS sampled the following for ACM and LBP in support of this project:

- I-40 reinforced corrugated metal pipe culvert (RCMP), near MP 48.3;
- West Kingman TI overpass (OP) westbound (WB), Structure #1836, MP 48.4;
- I-40 WB on-ramp yellow and white striping paint, MP 48.4;
- West Kingman TI OP eastbound (EB), Structure #1835, MP 48.4;
- I-40 Jersey barrier, MP 49;
- I-40 block sound wall, MP 49;
- Clack Canyon Wash Bridge EB, Structure #1837, MP 49.7;
- Clack Canyon Wash Bridge WB, Structure #1838, MP 49.7;
- Clack Canyon Road old and new yellow and white striping paint;
- White Cliff Road OP WB, Structure #1840, MP 50.09;
- White Cliff Road OP EB, Structure #1839, MP 50.09;
- US 93/West Beale Street reinforced concrete box culvert (RCB) near MP 70.3;
- US 93/West Beale Street white and blue curb paint near MP 70.3;
- US 93/West Beale Street silver/gray light pole paint;

- US 93/West Beale Street black sign pole paint;
- East Beale Street white crosswalk paint;
- East Beale Street white and yellow striping paint;
- East Beale Street yellow median paint; and
- Fort Beale Drive yellow striping paint at Betty Lane.

Attachment 1 contains project area maps. Attachment 2 contains project area photographs. Attachment 3 contains NESHAP notification information and a copy of the asbestos and LBP certificates for Amber Huntoon-Colvin. Amber Huntoon-Colvin is an Asbestos Hazard Emergency Response Act (AHERA)-certified Building Inspector and a US Environmental Protection Agency (EPA)-certified LBP Risk Assessor. Attachment 4 contains ACS sampling locations and analytical results forms. Attachment 5 contains laboratory reports and chain-of-custody (COC) documentation.

Methodology

Amber Huntoon-Colvin of ACS surveyed within the project limits for an initial site assessment on October 1 and 2, 2019, and collected samples from load-bearing components and painted surfaces on October 16 and 17, 2019. Spray-painted graffiti, if present, was not included in this survey. The following items were noted as they relate to this report:

- Due to safety concerns, the US 93 Jersey median barrier was not sampled.

One hundred and thirteen (113) suspect ACM bulk samples were collected during the survey within the project limits. Two representative bulk samples were collected from each unique combination of location and material type. In accordance with current ADOT guidance, paint samples were also analyzed for asbestos content (one sample per paint type). Bulk sample collection was performed in general accordance with AHERA sampling protocols per EPA regulations at 40 Code of Federal Regulations (CFR) 763.86. Each sample was collected by spraying the surface to be sampled with an amended water solution, removing a small piece of the material, and placing each sample into a plastic sample bag. Each sample bag was labeled with a unique sample identification number and logged on an ACS sampling form (Attachment 4). The samples were delivered to Fiberquant Analytical Services, Inc. (Fiberquant) under proper COC (Attachment 5) and analyzed for asbestos using polarized light microscopy (PLM). Fiberquant is accredited by the National Voluntary Accreditation Program for the analysis of bulk samples by PLM (No. 101031).

Seventeen (17) suspect LBP chip samples were collected during the survey of the target structures and area. Wherever possible, the sample was collected by removing a minimum of approximately 2 inches by 2 inches or an equivalent area of the painted surface down to, but not including, the substrate. Each sample was placed into a plastic sample bag, labeled with a unique sample identification number, and logged on an ACS sampling form (Attachment 4). These samples were delivered to Fiberquant under proper COC (Attachment 5) and analyzed for lead in paint by weight using EPA SW 846 Test Method 3050b/7420. Fiberquant is accredited by the American Industrial Hygiene Association (AIHA, Lab No. 101593) and is recognized by the National Lead Laboratory Accreditation Program (NLLAP) for the analysis of lead in paint.

Conclusions and Recommendations

ACS has the following conclusions and recommendations regarding this project:

Under 40 CFR 61, Subpart M, and 40 CFR 763, Subpart E, any material or product which contains greater than 1% asbestos is considered ACM.

- Due to sampling safety concerns, the US 93 Jersey median barrier was not sampled for ACM; therefore, this material should be sampled and analyzed prior to project construction;

- Asbestos at a level greater than 1% **was not detected** in any samples collected within the project limits. This project requires compliance with the NESHAP environmental commitment below.

Under Section 302(c) of the Lead-Poisoning Prevention Act, 42 United States Code (U.S.C.) 4822(c), and Section 401(9) of the Toxic Substances Control Act, 15 U.S.C. 2681(9), LBP is defined as paint with lead levels equal to or greater than 1.0 milligram/square centimeter (mg/cm²), or 0.5% by weight, or 5,000 milligrams/kilogram (mg/kg). The definition has been expanded to include varnish, shellac, and other coatings.

- Lead at a level greater than 0.5% by weight/5,000 mg/kg **was detected** in two samples collected within the project limits. Therefore, this material requires compliance with the LBP environmental commitments below.

The Occupational Safety and Health Administration (OSHA) construction lead standard at 29 CFR 1926.62 governs construction work where an employee may be occupationally exposed to lead. ADOT considers working with lead above the analytical detection level as a potential exposure to lead during construction work.

- Lead at a level greater than the analytical detection level **was detected** in multiple samples collected within the project limits.

Table 1 summarizes the lead paint findings related to this project.

Table 1 – Lead Paint Sampling Results			
	LBP	OSHA	
Location/Description	Lead levels ≥ 0.5% by weight/5,000 mg/kg	Lead levels ≥ analytical detection level	Results (ppm)
West Kingman TI WB NWC off-ramp catch basin gray drain grate paint	N	Y	47
West Kingman TI EB SEC catch basin orange drain grate paint	Y	Y	420,000
Clack Canyon Road white striping paint parallel to bridges	N	Y	57
Clack Canyon Road old yellow striping paint parallel to bridges (see Photograph 21)	Y	Y	7,600
US 93/W Beale Street white curb paint MP 70.3	N	Y	89
US 93/W Beale Street gray light pole paint MP 70.3	N	Y	2,300
US 93/W Beale Street black sign pole paint MP 70.3	N	Y	130
US 93/W Beale Street blue curb paint MP 70.3	N	Y	80
E Beal Street yellow striping paint	N	Y	47
E Beal Street yellow median paint	N	Y	340
LBP: lead-based paint, OSHA: Occupational Safety and Health Administration, ppm: parts per million (equivalent to milligrams per kilogram), NWC: northwest corner, TI: traffic interchange, WB: Westbound, N: no, Y: yes, EB: eastbound, SEC: southeast corner, US 93: US Highway 93, W: west, St: Street, MP: milepost.			

If any of the above-listed paint or a similarly painted component present within the project area will be disposed of or recycled, all applicable local, state, and federal guidelines shall be followed.

Environmental Commitments

Based on the sampling results for this project, the environmental commitments listed below apply.

ADOT and Contractor Responsibility - NESHAP

- The contractor shall complete a NESHAP notification for the work associated with the I-40 RCMP near MP 48.3, West Kingman TI OP EB/WB Structure #s 1835/1836, Clack Canyon Wash Bridges EB/WB Structure #s 1837/1838, White Cliff Road OP EB/WB Structure #s 1839/1840, and US 93 RCB near MP 70.3 and submit it to the Engineer, who shall submit it to the ADOT Environmental Planning hazardous materials coordinator (602.920.3882 or 602.712.7767) for a five (5) working day review and approval. Upon approval, the contractor shall file the notification with the Arizona Department of Environmental Quality at least ten (10) working days prior to the commencement of work associated with the OPs, bridges, and drainage structures within the project limits.

ADOT Responsibility – LBP

- No Clack Canyon Road old yellow striping paint parallel to the Clack Canyon Wash bridges disturbance will occur until the LBP Removal and Abatement Plan is approved and implemented.

Contractor Responsibilities – LBP

- For striping paint obliteration:
 - An approved contractor shall develop and implement a Lead-Based Paint Removal and Abatement Plan for the removal of the lead-based paint, Toxicity Characteristic Leaching Procedure testing of the generated waste stream, and proper disposal of the waste stream derived from the removal of the Clack Canyon Road old yellow striping paint parallel to the Clack Canyon Wash bridges within the project limits. The contractor shall select a lead abatement contractor that meets the qualification requirements specified within the special provisions and as approval by the Engineer. The contractor shall follow all applicable federal, state, and local codes and regulations, including Arizona Department of Transportation Standard Specifications for Road and Bridge Construction (2008 Edition), related to the treatment and handling of lead-based paint.
 - The contractor shall submit a Lead-Based Paint Removal and Abatement Plan for the removal of the Clack Canyon Road old yellow striping paint parallel to the Clack Canyon Wash bridges within the project limits to the Engineer and the Arizona Department of Transportation Environmental Planning hazardous materials coordinator (602.920.3882 or 602.712.7767) for review and approval at least 10 (ten) working days prior to paint striping obliteration activities.
 - No Clack Canyon Road old yellow striping parallel to the Clack Canyon Wash bridges paint obliteration shall occur until the Lead-Based Paint Removal and Abatement Plan is approved by the Arizona Department of Transportation Environmental Planning hazardous materials coordinator and implemented.
 - Visible fugitive dust emissions from paint removal shall be controlled through wet or dry (e.g., vacuum) means during the removal process. If the liquid waste stream generated by a water-blasting obliteration method passes the Toxicity Characteristic Leaching Process analysis, it may be used as a dust palliative or for compaction on the project. If the water is not used on the project, it shall be properly disposed of in accordance with all applicable federal, state, and local regulations.
- The contractor shall not utilize any abrasive tools or methods for the removal of the painted drainage grates that would disturb the lead-based paint. This includes, but is not limited to, sawing, grinding, sanding, or heating. Woven straps (not linked chains) may be used to lift the drainage grate from the frame; and

- For milling activities, the roadway surface preceding the milling machine shall be kept sufficiently wet so as to prevent the generation of any visible fugitive dust particles, but not so wet as to cause excess runoff from the roadway surface onto the roadway shoulder.

Limitations

The services described in this letter report were performed consistent with generally accepted professional consulting principles and practices. No other warranty, expressed or implied, is made. These services were performed consistent with our agreement and understanding of the scope of work with ADOT and Jacobs. This report is solely for the use and information of ADOT and Jacobs. During the survey, ACS endeavored to observe the existing conditions of the structures and roadway features with the degree of care which is ordinary for others performing similar services. Regardless of the thoroughness of any inspection, there is the possibility that potential ACM and/or LBP may be inaccessible or may be different from those at the sampling locations. If previously undiscovered materials potentially containing asbestos or LBP are encountered during the work at the site, it is recommended that the material be evaluated accordingly. Any reliance on this letter report by a third party is at such party's sole risk. ACS does not warrant the accuracy of information supplied by others or the use of segregated portions of this letter report.

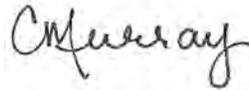

The environmental review, consultation, and other actions required by applicable federal environmental laws for this project are being, or have been, carried out by ADOT pursuant to 23 U.S.C. 326 and a Memorandum of Understanding dated January 3, 2018, and executed by the Federal Highway Administration (FHWA) and ADOT.

Thank you for allowing ACS to provide ADOT with our environmental services. If you have any questions or require additional information, please contact ACS at your convenience.

Sincerely,

Amber Huntoon-Colvin, M.S.
Environmental Scientist

TEMPE, AZ 85282-0000

Office Phone: (480) 894-5477

FAX: (480) 894-5478

Samples: 113 PLM **Rec:** 10/22/2019 **Method:** EPA 600/R-93/116 The "New" Method; see below
Client Job: I-40/US 93 Kingman TI **PO Number:** 18-096
Report Date: 10/25/2019 **Date Analyzed:** 10/25/2019 **Routing Number:** -

Method and Analysis Information: Fiberquant Internal SOP: PLMn

Each bulk sample is first dissected under a 7-30x magnification stereo-microscope. This examination is used to determine the general type of sample, how many and what type of layers it has, and initial estimates of fiber types and quantities. Second, liquid media mounts are made of each layer - such mounts may be of selected fibers (used solely for identification purposes) or may be representative of the layer as a whole (used for quantitation purposes). The mounts may be made in a synthetic Canadian balsam, one of several solvents, or in refractive index oils (media of known refractive index). Generally, a variety of different mounts are made: some optimized for fiber visibility, some optimized for fiber identification, and some optimized for fiber quantitation. The mounted slides are then examined at 50-400x magnification on a Nikon Labphot-pol microscope. Optical characteristics are used to identify each observed fiber type; the optical data are contained for each sample on its detail analysis sheet, attached.

Current EPA and NESHAP regulations designate a result of $\leq 1\%$ asbestos as "negative" or "non-regulated" and $> 1\%$ asbestos as "positive" or "regulated." Samples containing layers that have been determined to be "positive" may have to be handled differently during a renovation or demolition than samples whose layers have been determined to be "negative." OSHA under CFR 1926.1101 regulates work done involving any detectable concentration of asbestos.

The method of fiber identification and quantitation is the "Standard Operating Procedures for the Analysis of Asbestos in Bulk Samples using Polarized Light Microscopy", Chapter 7 of the Quality Assurance and Management Manual. This SOP and its associated reporting have been designed to satisfy all requirements in both EPA Method 600/M4-82-020 (The Interim Method) and EPA Method 600/R-93/116 (The New Method). The Interim Method is the required method for AHERA (US EPA 40 CFR Pt. 763), but this method calls for the reporting of composited results of multi-layered samples that is no longer an acceptable reporting practice in most circumstances. Current EPA rules, such as NESHAP (US EPA 40 CFR Pt. 61), as well as NVLAP accreditation policies, call for separate reporting for each layer of multi-layered samples. The New Method contains the same procedures for identification and quantification of asbestos as does the Interim Method, except that multi-layered samples are reported to comply with the latest US EPA rule. Fiberquant not only reports the asbestos content of each layer of multi-layered samples separately (satisfying current EPA and NVLAP reporting requirements), but Fiberquant also reports what percentage of the sample each layer comprises. Therefore, the results may be arithmetically composited to satisfy the reporting requirements of the Interim Method. The method of fiber quantitation is an estimation technique in which the analysts quantitation is routinely calibrated by reference quantitation standards, and which has been shown to be equivalent in precision and accuracy to point counting. Friability is estimated for the purposes of deciding when to point count. Friabilities determined in the field take precedence over those determined in the laboratory. Those sample layers which are friable and estimated by the analyst to contain $\leq 1\%$ asbestos are point counted using 400 points. Such point counting is required by NESHAP (National Emission Standards for Hazardous Air Pollutants, Nov. 1990) in order to rely on analytical results that are $\leq 1\%$. The coefficient of variation for the estimation quantitation technique is 100% in the range 0-5%. This means that PLM analysis is not capable of conclusively determining whether a layer containing close to 1% asbestos is actually "positive" or "negative". For this reason, Fiberquant refers to results where asbestos was detected but $\leq 1\%$ as "borderline negative", and results where asbestos was $> 1\%$ but $\leq 2\%$ as "borderline positive" to indicate the uncertainty in assigning a "positive" or "negative" label. In the sample summary, "ND" means that no asbestos was detected during the analysis. A "Tr" or "Trace" of asbestos reported is defined for our purposes as the detection of several asbestos fibers during the analysis; this level would be right at the limit of detection for the method. Trace is only reported on the analysis detail - in the summary a trace would be reported as $\leq 1\%$. The limit of detection (the smallest % of asbestos that can be detected) varies greatly depending on the matrix in which the asbestos is found. As little as 0.001% asbestos can be detected in favorable samples, while detection in unfavorable samples may approach the detection limit of 1% stated in the method. During the analysis, the analyst, for Fiberquant identification purposes only, determines the "apparent sample type" and "apparent layer types." It must be emphasized that these types are only what is apparent. Often, different materials appear similar or identical after sampling, so the analyst may assign a type other than what was sampled.

Floor tiles present a special problem for PLM asbestos analysis. Floor tile can contain chrysotile fibers so thin that they cannot be resolved by optical methods. In such a case, we may observe a percentage of asbestos which is lower than the actual percentage, or not observe asbestos at all when some is present. For this reason, floor tiles reported as negative should be confirmed to be negative using transmission electron microscope (TEM) analysis. Likewise, vermiculite insulation materials containing traces of asbestiform asbestos present a problem for routine PLM analysis - the amphiboles are sometimes present in trace amounts inhomogeneously distributed. For this reason, loose vermiculite samples reported as negative should be confirmed to contain no amphibole using hydroseparation techniques.

The samples were analyzed under the following ongoing quality assurance program: Blank samples are routinely analyzed to maintain contamination-free materials. Each analyst has at least a bachelor's degree in physical science, and has also completed extensive training specific to asbestos analysis for 1-3 months before being allowed to analyze client samples. Qualitative reference samples are routinely analyzed to assure that analysts

can identify asbestos and asbestos-look-alike fibers. Quantitative reference samples are routinely analyzed to calibrate and characterize the estimation procedure. Microscope alignment is checked each day. Refractive index oils are calibrated at least quarterly. At least 10% of client samples are re-analyzed from scratch by a different analyst than the original, and any discrepancies are resolved for the sample and similar sample types before the results are reported. All quality checks performed for these samples were in control except as detailed in the "Analytical Notes" below. All analysts participate in interlab round robins and proficiency testing to assure competence. Fiberquant is accredited by NVLAP (Lab code #101031) for the analysis of bulk samples for asbestos using PLM. Accreditation does not imply endorsement by the EPA, any other United States governmental agency or any private agency or association. Each lab analysis refers only to the sample tested, and may not, due to the sampling process, be representative of the material sampled. This report may not be reproduced except in full, without the approval of Fiberquant Analytical Services.

Some results may have been calculated using client supplied data, such as volume or area sampled, for which Fiberquant assumes no liability for accuracy.

Job Analysis Notes:

Sample bag 61 was empty. Per client instructions, take some material from sample 60.

PLM Analysis Summary:

Method and Analysis Information:

Fiberquant Internal SOP: AApw

The received samples were analyzed for Pb (total) using "Test Methods for Evaluating Solid Waste" (SW 846, December 1996 updates). The extraction/digestion method was SW 3050b. The analytical method is "flame atomic absorption, direct aspiration", SW 7420. Briefly the procedures are as follows. The incoming paint samples are first homogenized by mixing and crushing. A sub-sample is weighed to 0.0001 gm into a 50ml centrifuge tube. To the run stream are added the quality assurance samples described below. Six mls of concentrated HNO3 and one ml of 30% H2O2 are added to each container. The tubes are capped and heated for 1 hour at 95 deg. C. After cooling, the contents of the centrifuge tube are brought up to exactly 25 mls, completing the digestion/extraction.

The sample and quality assurance extractions are then analyzed on a Thermo M5 flame atomic absorption spectrometer or a Perkin Elmer Analyst 200. The wavelengths and other instrumental settings are set according to the manufacturer's recommendations, or as otherwise specified in the published method. Absorptions are recorded from sample and standard solutions. A calibration curve is fitted to at least three standard solutions, and the concentrations of the sample extracts are calculated from the curve. The ppm (ug/gm) and weight percent for each sample is calculated from the sub-sample weight, extract volume, and extract concentration.

The results from this analysis is generally compared to either the HUD guidelines, in which a sample is positive if it contains >0.5% (5000 ppm) Pb, or the Consumer Products Safety Commission (CPSC) limit, in which a paint or surface coating containing greater than 90 ppm is defined as lead-containing. The expected coefficient of variation for this method is approximately 20-30%. The results are reported to two significant figures. The Sample Reporting Limit (RL) listed below is twice the Sample Detection Limit, which is calculated for each sample from the experimentally determined Method Detection Limit. The limit of reliable quantitation is generally regarded as five to ten times the limit of detection. Therefore, samples smaller than 0.1 gm may give results too near the CPSC standard to be reliable. Problems in analysis or other information is provided in the "Analytical Notes" below. Blanks, if analyzed, are treated the same as samples and are not used for correcting non-blank results.

The following on-going quality assurance program was followed to ensure reproducible and dependable results: All analysts are degreed chemists trained extensively in-house for at least six months prior to un-supervised runs. Blank matrix samples are analyzed at a rate of 5% (at least one per run). Reference standards are analyzed at a rate of 5% (at least one per run), and compared to statistical records via control charts. Spiked matrix samples are analyzed at a rate of 5% (at least one per run), and compared to statistical records via control charts. Duplicate samples are analyzed at a rate of 5% (at least one per run), and compared to statistical records via control charts. For each instrumental run, the spectrometer is checked for sensitivity and stability. The calibration standards are made fresh weekly, and checked each run against a calibration verification standard from another source. All calculations are performed twice - once in a calibration spreadsheet, and once during the report generation, and also checked by hand. All quality checks performed for these samples were in control except as detailed in the "Analytical Notes" below. Fiberquant participates in the Environmental Lead Proficiency Analytical Testing (ELPAT) program, is accredited by AIHA-LAP, LLC for environmental lead in paint (Lab # 101593), and is recognized by the National Lead Laboratory Accreditation Program (NLLAP) for the analysis of Pb in paint. Accreditation does not imply endorsement by the EPA, any other United States governmental agency or any private agency or association. Each lab analysis refers only to the sample tested, and may not, due to the sampling process, be representative of the material sampled. This report may not be reproduced except in full, without the approval of Fiberquant Analytical Services.

Some results may have been calculated using client supplied data, such as volume or area sampled, for which Fiberquant assumes no liability for accuracy.
